European Centre for Medium-Range Weather Forecasts

Why VAREPS?

VAREPS aims to increase the value of the current EPS in two ways:

- up to fc d7, by providing more skilful predictions of small-scale, severe events
- ✤ after fc d7, by extending the range of skilful products from 10 to 15 days

VAREPS will also provide the first 2-legs of ECMWF planned seamless ensemble system, which will be extended initially to one month, and then to a longer forecast time.

The key idea behind VAREPS is to resolve small-scales in the forecast up to the forecast range when resolving them improves the forecast, but dropping them when their impact is negligible.

то		T+360	• T+768

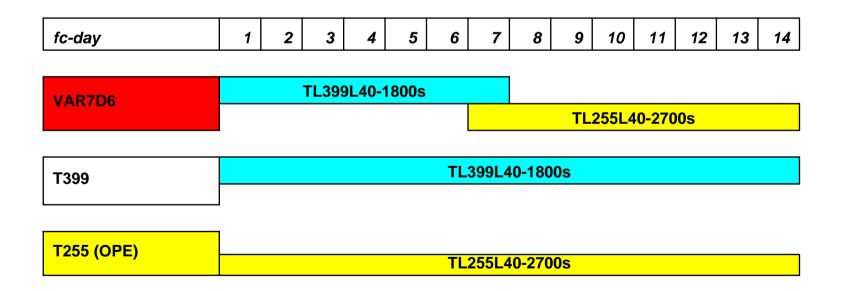

EPS configurations tested with 51-members (CY28R3)

The performance of ensembles run in the following four configurations have been compared for **46 cases** (21 cases from warm and 25 from cold seasons).

Average results are based on the comparison of 500 hPa geopotential height (Z500), 850 hPa temperature and total precipitation (TP) forecasts. Case studies have also considered significant wave height and 850hPa wind.

Summary with key conclusions

1. Expected average impact of EPS upgrade

Results based on the comparison of Z500 and total precipitation predictions (46 cases, 51mem) indicate that in the 1st week, VAREPS will deliver gains of up to 12h, and in the 2nd week it will give users access to skilful probabilistic forecasts.

2. Impact of EPS upgrade on severe weather forecasts

 In the 1st week, VAREPS(T399) will deliver more accurate predictions of intense cyclonic developments (both in terms of intensity and position), wind speed, significant wave height and precipitation.

3. The future: a seamless ensemble system from day 0 to day 32

- The first cases of 3-leg VAREPS have been completed. The configuration planned to be implemented in Q1/2006 will (most probably) be:
 - Day 0-7: $T_1 399L62^{DT1800s}$
 - Day 6-15: T_{I} 255L62^{DT2700s}
 - Day 15-32: $\overline{T_L}$ 255L62^{DT2700s} coupled with ocean model

Outline

1. Expected average impact of EPS upgrade

2. Impact of EPS upgrade on forecasts of severe weather

- Hurricane Katrina (29 August 2005)
- Hurricane Stan (6 October 2005)
- UK storms (27 Oct 2002 and 12 Jan 2004)
- Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

3. The future: a seamless ensemble system from day 0 to day 32

1. Expected average impact of EPS upgrade

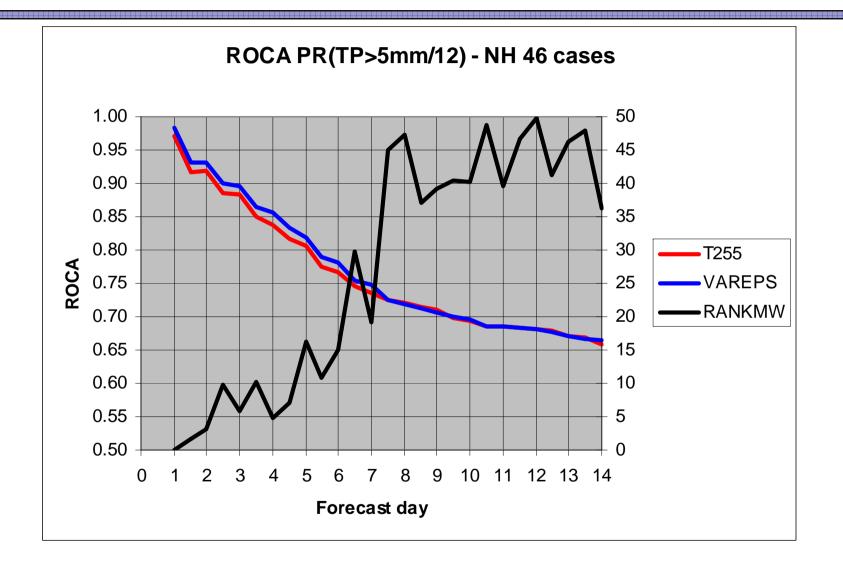

Average results (46 cases) and case-studies indicate that VAREPS will give:

- In the 1^{st} week (day 0-7):
 - More accurate synoptic scale prediction, with predictability gains for probabilistic forecasts of Z500 anomalies of ~6h
 - More accurate precipitation predictions, with predictability gains of probabilistic forecasts of 5-10-20 mm/d of 6 to 12h
 - More accurate prediction of severe weather events, such as hurricanes or intense extra-tropical storms, with up to 50% reductions of intensity and position errors of MSLP local minima
- In the 2^{nd} week (day 7-15):
 - Skilful probabilistic predictions of precipitation in excess of 5-10 mm/d
 - Skilful ensemble-mean and probabilistic predictions of Z500 and T850 anomalies

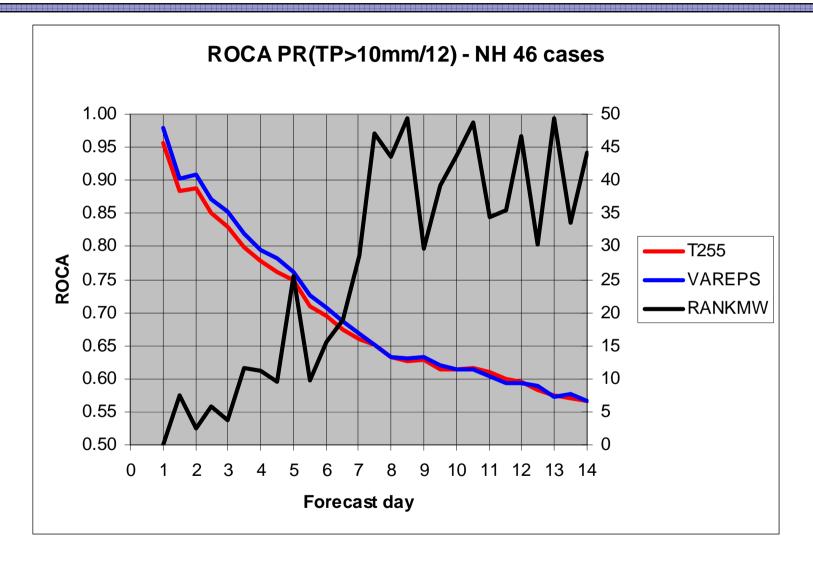

1. Expected impact of EPS upgrade: π **[TP12** \geq **5mm]**

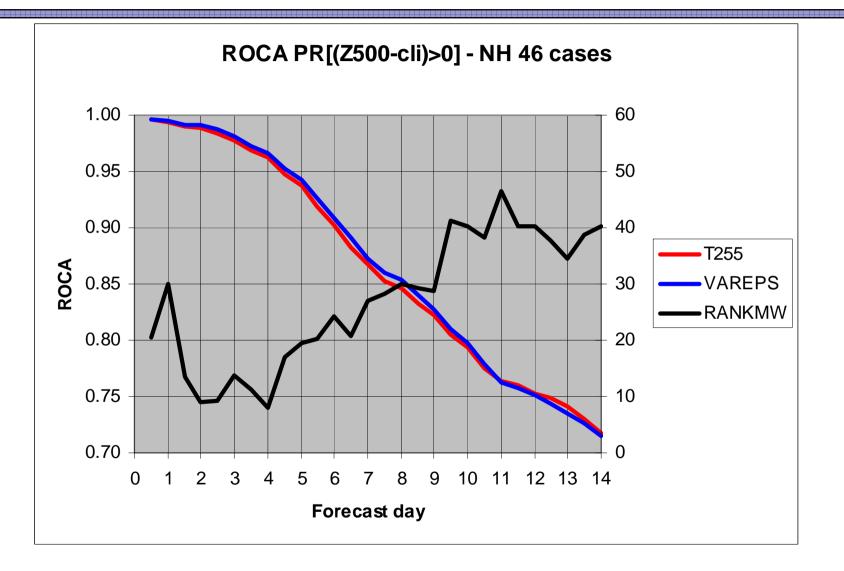

1. Expected impact of EPS upgrade: *π***[TP12**≥10mm]

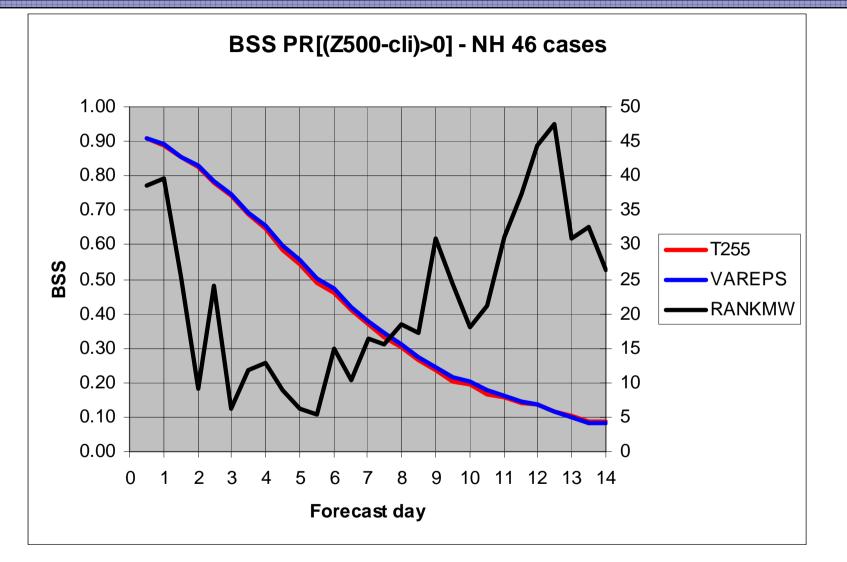

1. Expected impact of EPS upgrade: π[(Z500-cli)>0]

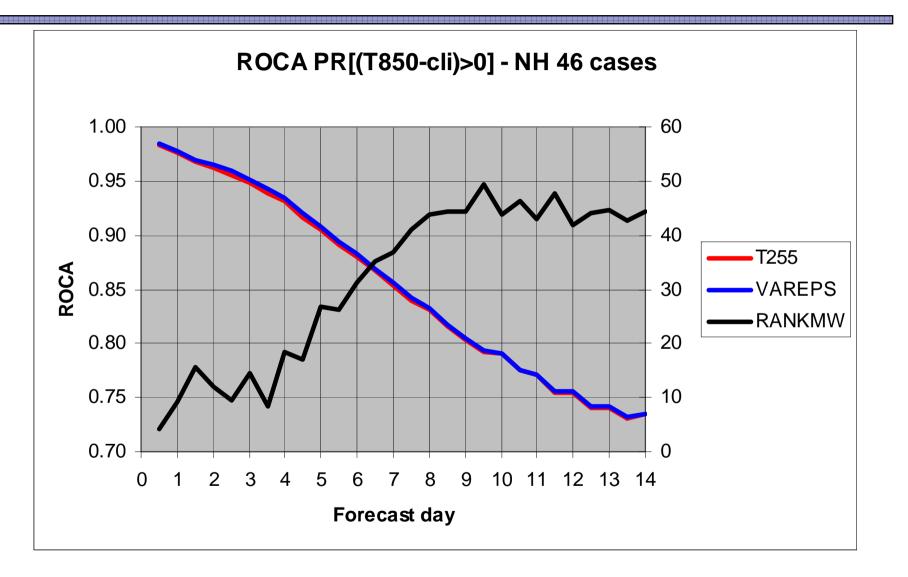

1. Expected impact of EPS upgrade: π[(Z500-cli)>0]

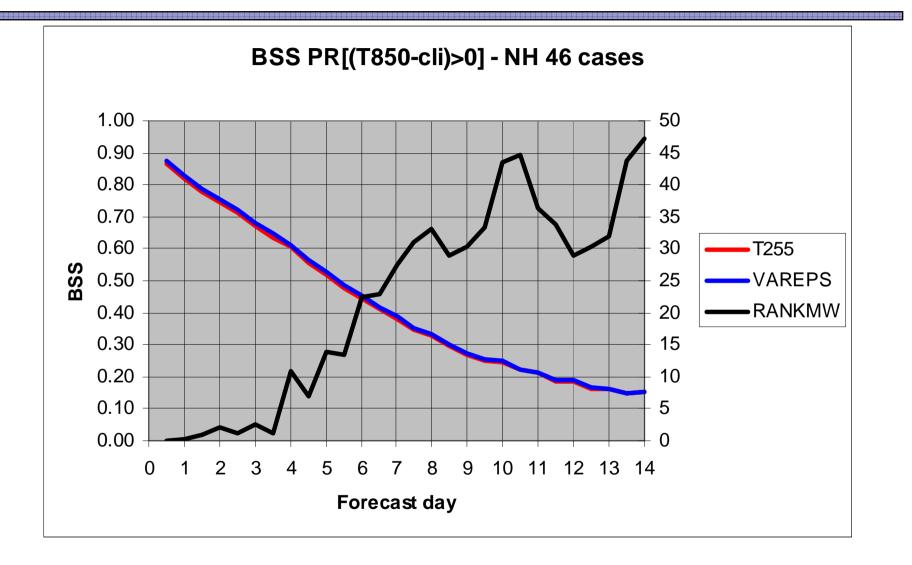

1. Expected impact of EPS upgrade: π [(T850-cli)>0]

1. Expected impact of EPS upgrade: π [(T850-cli)>0]

Outline

1. Expected average impact of EPS upgrade

2. Impact of EPS upgrade on forecasts of severe weather

- Hurricane Katrina (29 August 2005)
- Hurricane Stan (6 October 2005)
- UK storms (27 Oct 2002 and 12 Jan 2004)
- Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

3. The future: a seamless ensemble system from day 0 to day 32

2. Case studies: key conclusions

Hurricane Katrina (29 August 2005)

Comparison of +84, +96 and +108h forecasts indicates that VAREPS(T399) gives a more accurate cyclone intensity prediction, with VAREPS forecasts being on average deeper (~50% reduction in average absolute intensity error). This has a substantial positive impact on probabilistic predictions of MSLP minima, wind speed and significant wave height.

Hurricane Stan (6 October 2005)

 Comparison of +72, +96, +120 and +144h forecasts indicates that VAREPS(T399) gives a more accurate precipitation prediction, especially for higher thresholds (above 25 mm/d).

UK storms (27 Oct 2002 and 12 Jan 2004)

- For both storms, comparison of +72h forecasts indicates that VAREPS forecasts are more accurate in locating the low pressure system (5% reduction in position error), while differences in intensity are small. This has a positive impact on the probabilistic prediction of wind speed.
- For the 2nd storm, VAREPS forecast are better capable to predict the development and propagation of two small-scale vortices located at very short distance.

Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

 For both floods, VAREPS probabilistic precipitation forecasts are more accurate (Brier scores are ~5% lower).

Outline

1. Expected average impact of EPS upgrade

2. Impact of EPS upgrade on forecasts of severe weather

- Hurricane Katrina (29 August 2005)
- Hurricane Stan (6 October 2005)
- UK storms (27 Oct 2002 and 12 Jan 2004)
- Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

3. The future: a seamless ensemble system from day 0 to day 32

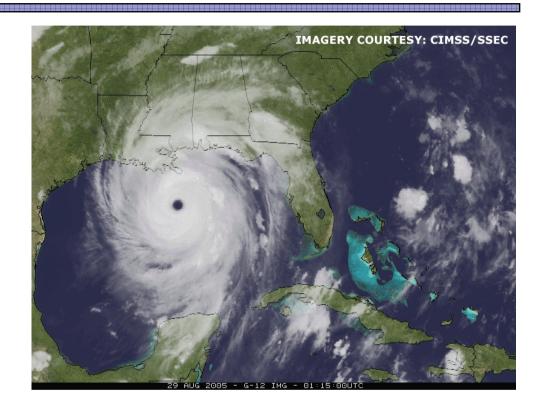

2. Hurricane Katrina: 26-29 August 2005

Katrina was one of the strongest storms of the last 100y

Sustained winds at landfall of 140mph, and minimum central pressure recorded of 920hPa (3rd lowest recorded for a land-falling Atlantic storm in the US)

Developed initially as a tropical depression southeast of the Bahamas on 23 Aug

- Cat-I when landed in Florida
- Reached maximum intensity (Cat-V) on 28 Aug
- Cat IV at landing

2. Hurricane Katrina: impact

 Loss of life is still unknown but likely to be in the 100s

 80% of New Orleans was under flood water on 31 Aug due to levee failures from Lake Pontchartrain

Oil production in the Gulf of Mexico was reduced by 1.4mbd (down to only 5% of daily production)

Power shortages affected over
1.7m people (*source: NCDC*)

Costs to the insurance and reinsurance industries estimated to be ~\$40-60bn (*source: FT*) (for comparison, Andrew damages adjusted for inflation were \$25bn)

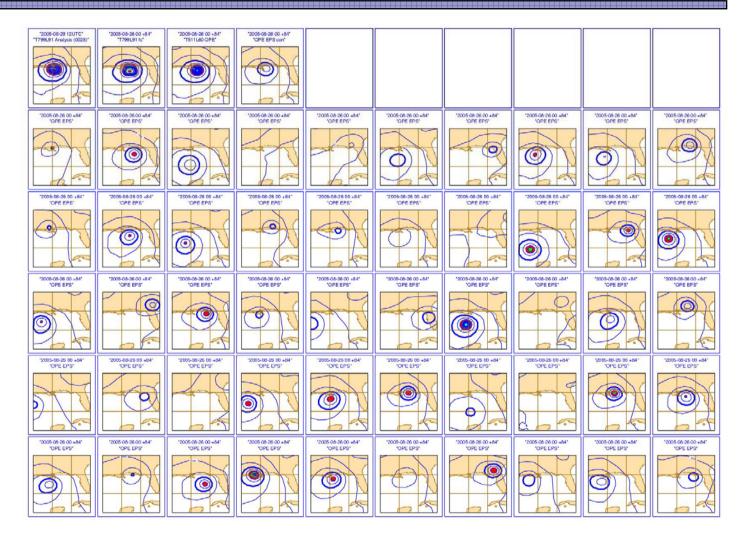

2. Kat: T255 EPS from OPEan, 2005-08-26 00 +84h

Top row: T799an, T799 fc, T511fc, EPS control

Other rows: EPSperturbed members1 to 50

(All but T799 fcs started from T511 OPE analysis, T799 fc started from T799 analysis.)

Each panel shows MLSP with a 5hPa contour interval and shading for values below 990hPa.

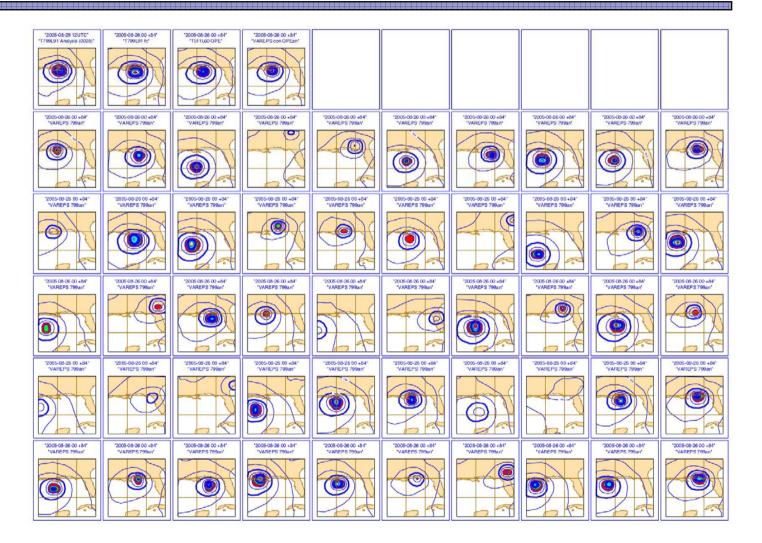

2. Kat: VAREPS(T399) from OPEan, 2005-08-26 00 +84h

Top row: T799

fc, EPS control

Other rows: EPSperturbed members1 to 50

(All but T799 fcs started from OPE T511 analysis.)

Each panel shows MLSP with a 5hPa contour interval and shading for values below 990hPa.

2. Kat: intensity and position error in +84h MSLP pert-mem

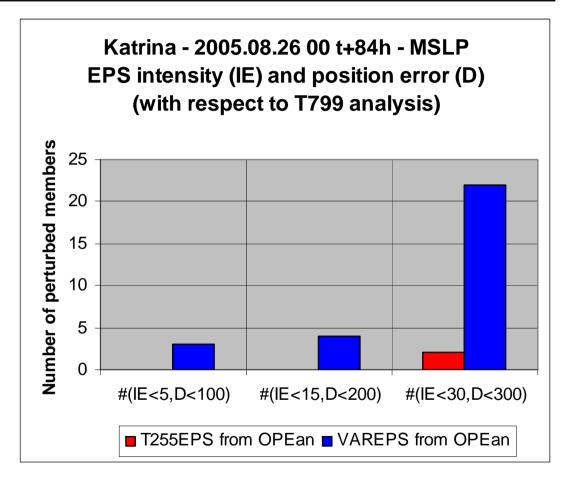

The three sets of bars show the number of perturbed members with intensity (IE) and position (D) errors inside three categories:

- IE<5hPa and D<100km</p>
- IE<15hPa and D<200km</p>

IE<30hPa and D<300km(with respect to T799 analysis)

Two ensemble configurations are compared:

- T255 from OPEan (T511L60)
- VAREPS (T399) from OPEan

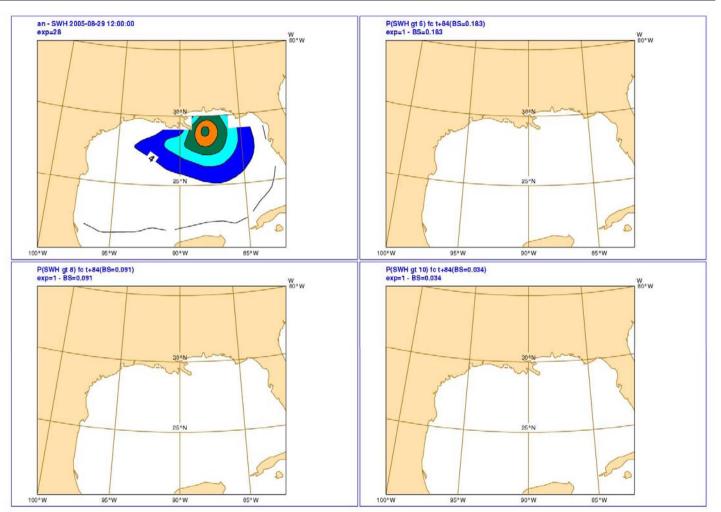

2. Kat: SWH prob in T255 from OPEan in +84h fcs

The top-left panel shows the significant wave height (SWH) in the T799 analysis (cont interval is 2m).

The other panels show the probabilities that:

- SWH>6m (t-right)
- SWH>8m (b-left)
- SWH>10m (b-right)

Prob cont iso are 2/5/10/20/40/60%.

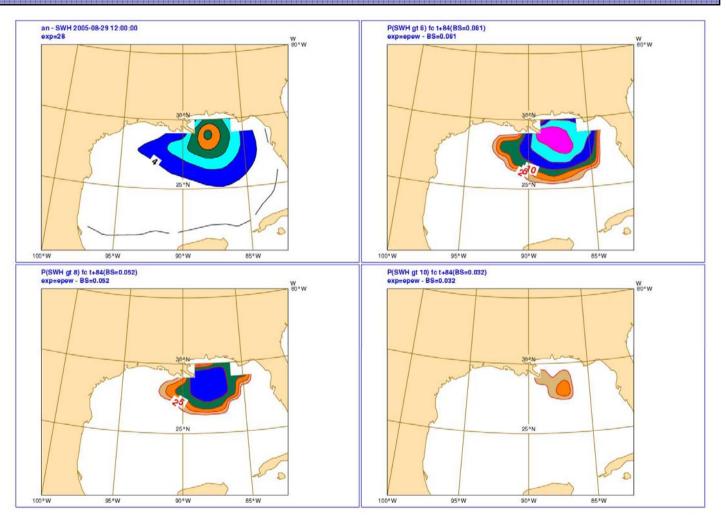

2. Kat: SWH prob in VAREPS(T399) from OPEan in +84h fcs

The top-left panel shows the significant wave height (SWH) in the T799 analysis (cont interval is 2m).

The other panels show the probabilities that:

- SWH>6m (t-right)
- SWH>8m (b-left)
- SWH>10m (b-right)

Prob cont iso are 2/5/10/20/40/60%.

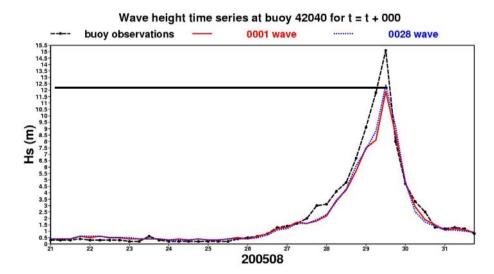

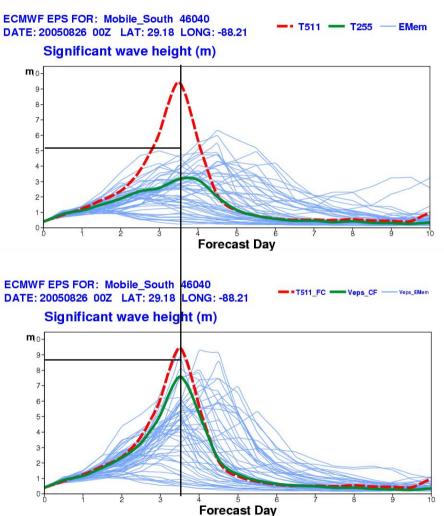

2. Kat: SWH t+84h fcs at buoy, VAREPS and EPS

Buoy 42040 obs for 12UTC of 29 Aug and t+84h forecasts from 26 Aug 00UTC. Bottom-left panel: buoy measured SWH of 15m. ECMWF analysis at T511 and T799 produced SWH of 12m. EPS forecasts were up to ~5m (top-right), while VAREPS forecasts reached 9m (bottom-right).

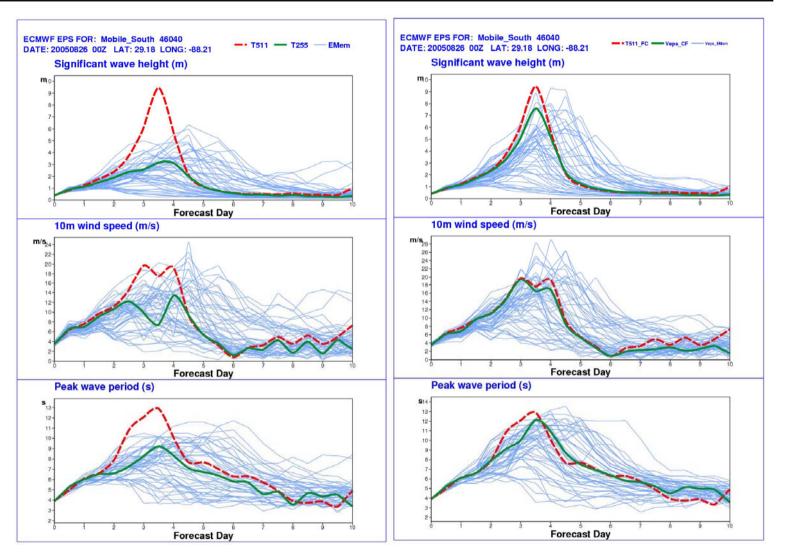

CECMWF

2. Kat: t+84h fcs at buoy, VAREPS and EPS

T+84h forecasts from 26 Aug at 00UTC from EPS (left) and VAREPS (right) SWH, 10m wind speed and peak wave period at buoy 42040.

2. Kat: intensity and position error in +96h MSLP pert-mem

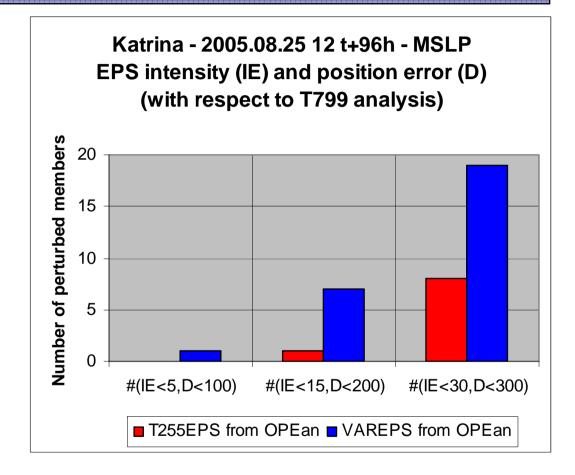

The three sets of bars show the number of perturbed members with intensity (IE) and position (D) errors inside three categories:

- IE<5hPa and D<100km</p>
- IE<15hPa and D<200km</p>

IE<30hPa and D<300km(with respect to T799 analysis)

Two ensemble configurations are compared:

- T255 from OPEan (T511L60)
- VAREPS (T399) from OPEan

2. Kat: intensity and position error in +108h MSLP pert-mem

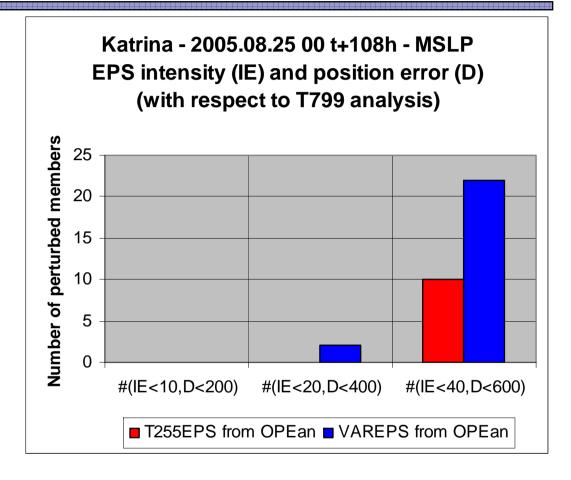

The three sets of bars show the number of perturbed members with intensity (IE) and position (D) errors inside three categories:

- IE<10hPa and D<200km</p>
- IE<20hPa and D<400km</p>

IE<40hPa and D<600km(with respect to T799 analysis)

Two ensemble configurations are compared:

- T255 from OPEan (T511L60)
- VAREPS (T399) from OPEan

Outline

- UK storms (27 Oct 2002 and 12 Jan 2004)
- Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

3. The future: a seamless ensemble system from day 0 to day 32

2. Hurricane Stan: 6-7 October 2005

11 October 2005 - The death toll from mudslides and flooding triggered by Hurricane Stan in Guatemala has risen to 652. It is estimated that as many as 98,000 Guatemalan residents have suffered property damage as a result of the disaster.

The footage of Guatemala and El Salvador is reminiscent of Hurricane Katrina - except the victims this time around are farmers and villagers, and the homes destroyed were not located along Bourbon Street, but on the Central American countryside. More disastrously, though, these homes were not made of concrete, but rather of mud and clay. Hurricane Stan, though not as potent as Katrina, has had an equally devastating effect, as the infrastructure in these countries is not designed to resist a hurricane.

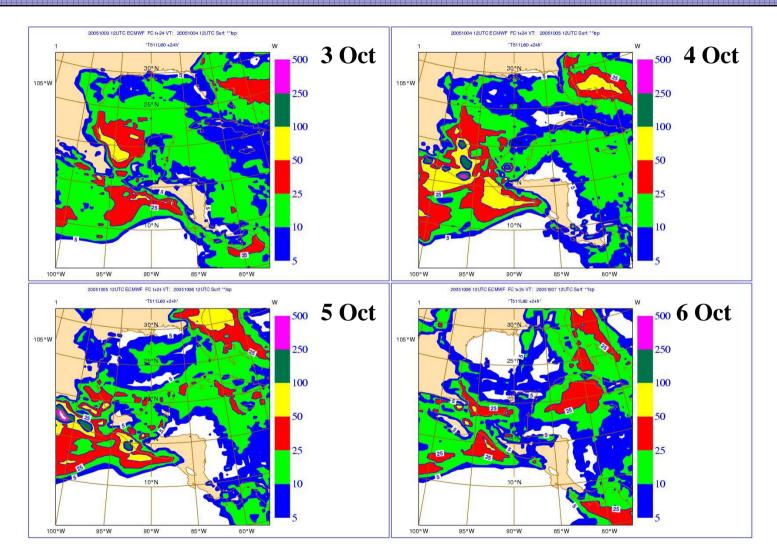

2. Stan: TP24h in T511 fcs from 12UTC of 3-4-5-6 Oct 2005

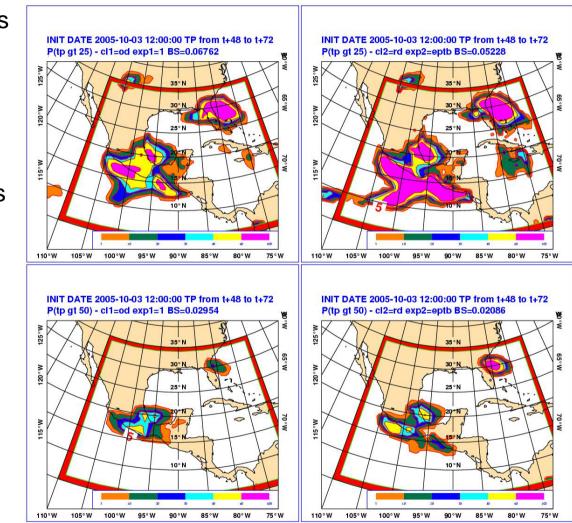

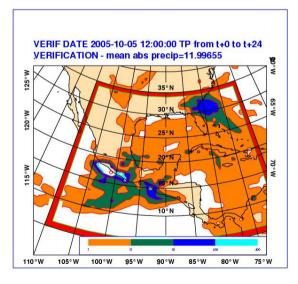

2. Stan: PR(TP24>thr) in +72h forecasts valid for 6 Oct 12Z

Panels to the right: t+72h forecasts of PR[TP24>25mm] (top) and PR[TP24>50mm] (bottom) started at 12Z of 3 Oct in the T255 (left) and VAREPS (right) ensembles. The bottom panel shows precipitation verification defined as the T511 t+24h TP.

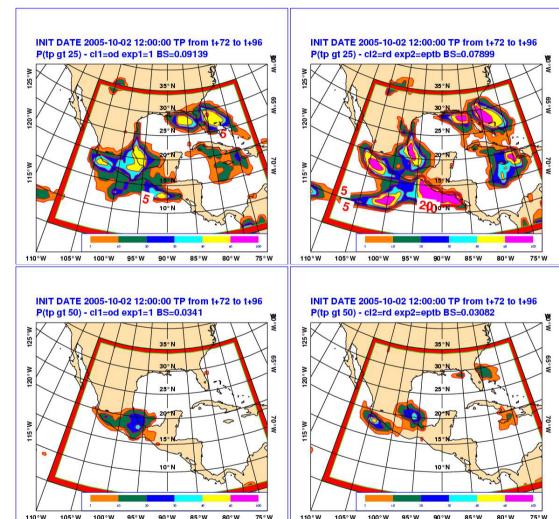

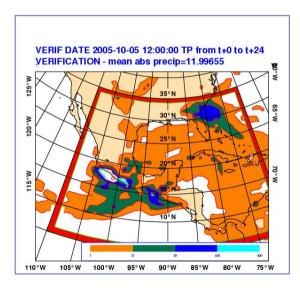

ECECMWF

2. Stan: PR(TP24>thr) in +96h forecasts valid for 6 Oct 12Z

Panels to the right: t+96h forecasts of PR[TP24>25mm] (top) and PR[TP24>50mm] (bottom) started at 12Z of 2 Oct in the T255 (left) and VAREPS (right) ensembles. The bottom panel shows precipitation verification defined as the T511 t+24h TP.

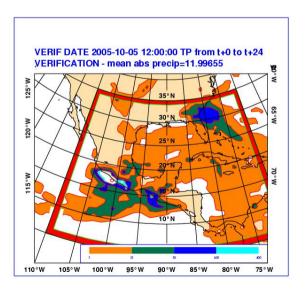

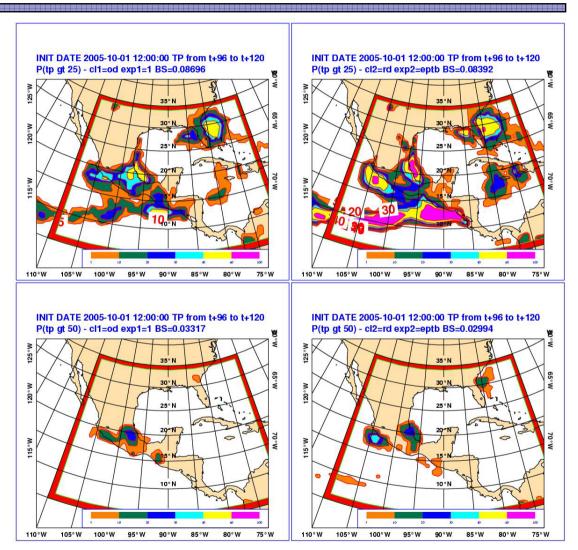

CECMWF

2. Stan: PR(TP24>thr) in +120h forecasts valid for 6 Oct 12Z

Panels to the right: t+120h forecasts of PR[TP24>25mm] (top) and PR[TP24>50mm] (bottom) started at 12Z of 1 Oct in the T255 (left) and VAREPS (right) ensembles. The bottom panel shows precipitation verification defined as the T511 t+24h TP.

Outline

1. Expected average impact of EPS upgrade

2. Impact of EPS upgrade on forecasts of severe weather

- Hurricane Katrina (29 August 2005)
- Hurricane Stan (6 October 2005)
- UK storms (27 Oct 2002 and 12 Jan 2004)
- Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

3. The future: a seamless ensemble system from day 0 to day 32

From the UK MetOffice News Releases:

24 October 2002. Severe gales are forecast to hit much of England and Wales on Sunday (27 Oct). The south-west, southern England and Wales will take the brunt of the storm, the Met Office is warning. Damaging gusts of up to 80 m.p.h. are expected on exposed coasts and hills and up to 70 m.p.h. over inland areas. The winds will be strong enough to blow over trees and could cause structural damage.

27 October 2002. Storm warnings issued late last week came true today as winds in excess of 80 m.p.h. hit parts of England and Wales. The Atlantic storm crossed Ireland overnight, then the Isle of Man and northern England this morning, en route to the North Sea this afternoon. A wind of 96 m.p.h. was recorded earlier today at Mumbles near Swansea and many areas saw gusts of 60 to 80 m.p.h. In terms of wind speed, it was the biggest storm since late October 2000 when the Isle of Wight recorded 100 m.p.h. winds and 90 m.p.h. winds affected coastal parts of south-west England and south Wales.

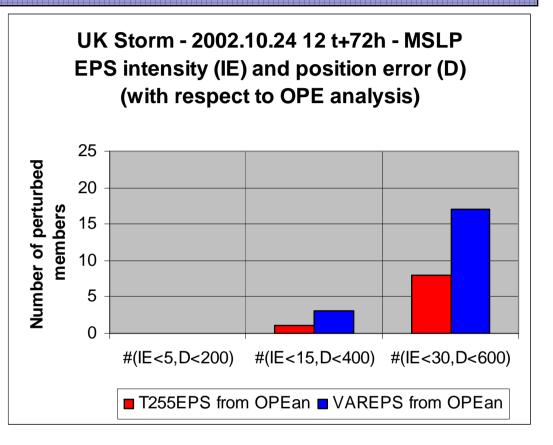

2. UK storm 1: intensity/position err in +72h MSLP pert-mem

The three sets of bars show the number of perturbed members with intensity (IE) and position (D) errors inside three categories:

- IE<5hPa and D<100km</p>
- IE<15hPa and D<200km</p>
- IE<30hPa and D<300km</p>

Two ensemble configurations are compared:

- T255 from OPEan (T511L60)
- VAREPS (T399) from OPEan

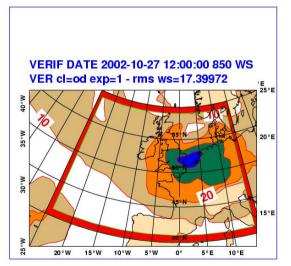

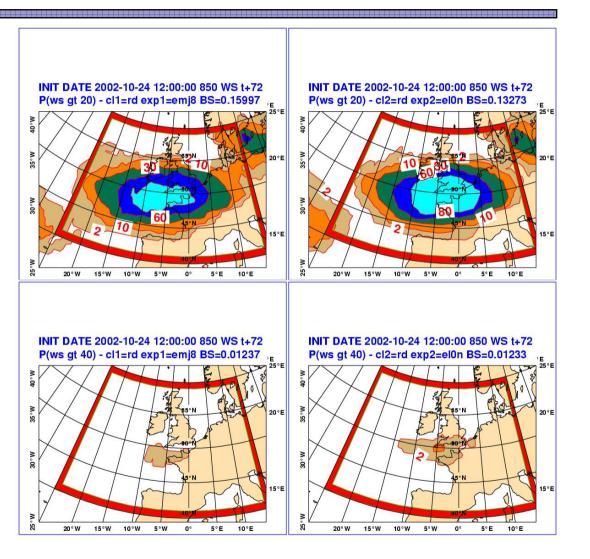

2. UK storm 2: PR(850WS>thr) in +72h forecasts

Panels to the right: t+72h forecasts of PR[WS>20m/s] (top) and PR[WS>40m/s] (bottom) started at 12Z of 24 Oct in the T255 (left) and VAREPS (right) ensembles.

The bottom panel shows the wind-speed in the analysis.

From the UK MetOffice News Releases:

✤ 9 January 2004. Heavy rain and gales are expected to return to Britain early next week, the Met Office is warning. Forecasters are warning of the potential for stormy conditions across the country with winds of 70 m.p.h. across southern and western parts during Monday (12 Jan), with gusts possibly as high as 100 m.p.h. in exposed areas. There is also the possibility of heavy snowfall adding to the difficult conditions for northern areas.

14 January 2004. The Met Office has issued a statement saying the snow that has hit Wales, the Midlands and Eastern England today came from a weather system which was particularly difficult to forecast. The prolonged and heavy rain turned readily to snow as temperatures fell further than expected. Conditions are expected to improve later today, but further wintry conditions can be expected for some areas over the next few days.

2. UK storm 2: intensity/position err in +72h MSLP pert-mem

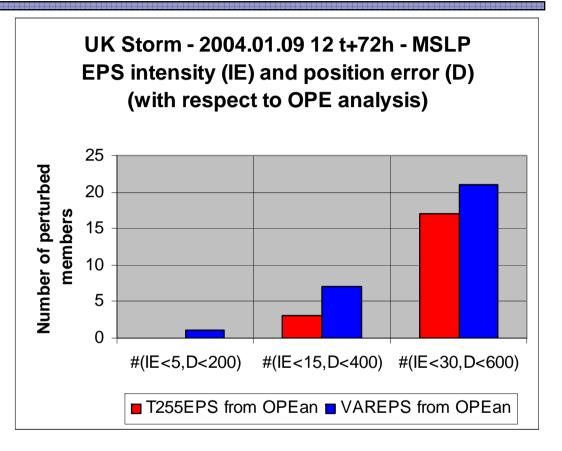

The three sets of bars show the number of perturbed members with intensity (IE) and position (D) errors inside three categories:

- IE<5hPa and D<100km</p>
- IE<15hPa and D<200km</p>

IE<30hPa and D<300km(with respect to T799 analysis)

Two ensemble configurations are compared:

- T255 from OPEan (T511L60)
- VAREPS (T399) from OPEan

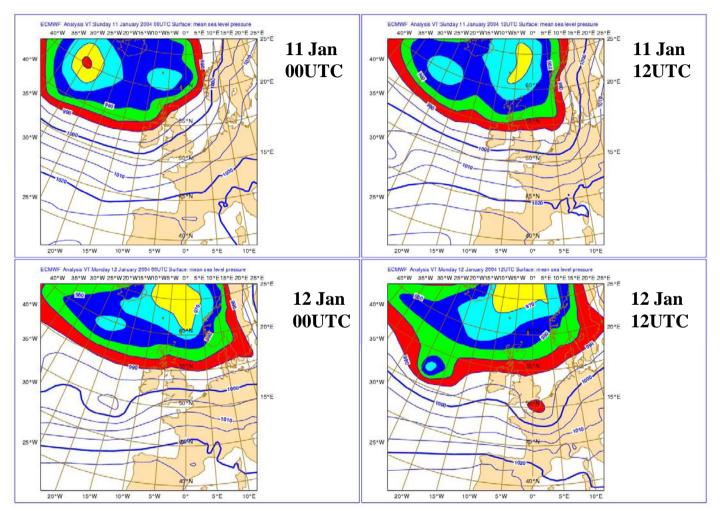

2. UK storm 2: 12 January 2004, 12 UTC

Difficult situation to predict, due to the rapid development and propagation of two cyclones within a short distance.

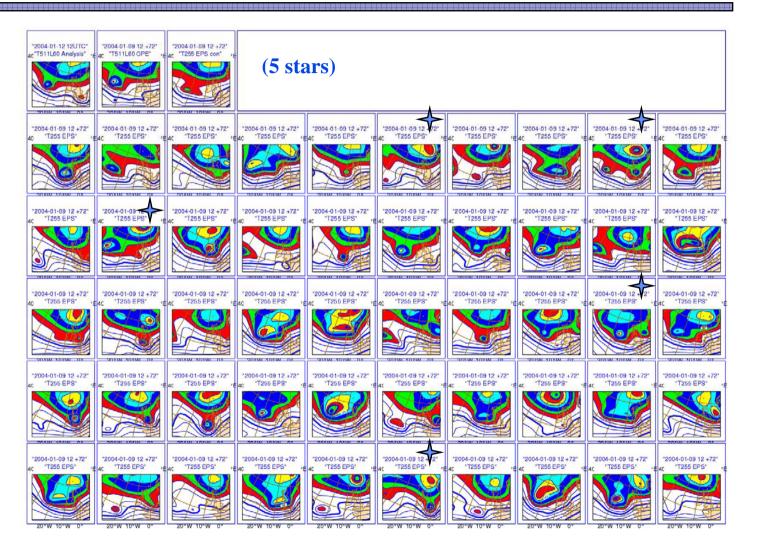

2. UK storm 2: T255 EPS from OPEan, 2004-01-09 12 +72h

- Top row: T511 an, T511 fc, EPS control

1. Expected average impact of EPS upgrade

2. Impact of EPS upgrade on forecasts of severe weather

- Hurricane Katrina (29 August 2005)
- Hurricane Stan (6 October 2005)
- Hurricane Wilma (24 October 2005)
- UK storms (27 Oct 2002 and 12 Jan 2004)
- Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

3. The future: a seamless ensemble system from day 0 to day 32

2. Flood over Central Europe: 12 August 2002

PRAGUE, 13 august (CNN) - Powerful floods have now killed 94 people across Europe, including five new deaths in Germany on Wednesday. About 50,000 Prague residents have been evacuated, including those in the historic Old Town, as emergency workers continued laying sandbags along the rising River VItava and outside buildings.

Eight people have died in the floods in the Czech Republic but damage to the city's medieval buildings cannot be assessed until the levels of muddy water, covering many first and second floors, recede. Workers were fighting to save the 14th century Charles Bridge, one of the city's most popular landmarks.

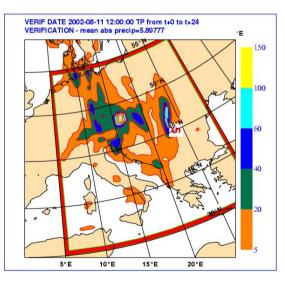

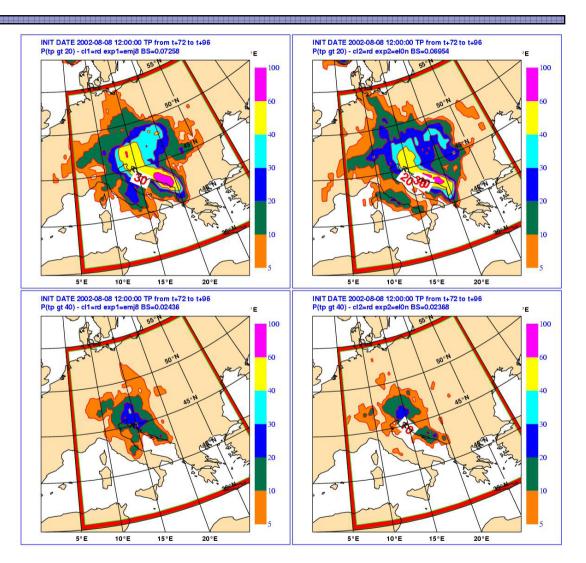

2. Flood of Aug 2002: PR(TP24>thr) in +96h forecasts

Panels to the right: t+96h forecasts of PR[TP24>20mm] (top) and PR[TP24>40mm] (bottom) started at 12Z of 8 Aug in the T255 (left) and VAREPS (right) ensembles.

The bottom panel shows precipitation verification defined as the T511 t+24h TP.

2. Flood over Switzerland and Italy: 15 October 2000

GONDO, Switzerland (Reuters) - The 13 people still missing after a mudslide ravaged the village of Gondo on the Swiss-Italian border are assumed to be dead, the local police said on Sunday.

Heavy rains were causing problems elsewhere in Switzerland and northern Italy. Lake Maggiore flooded part of Lugano and in the Valais many train connections were cancelled as tracks were blocked or under water.

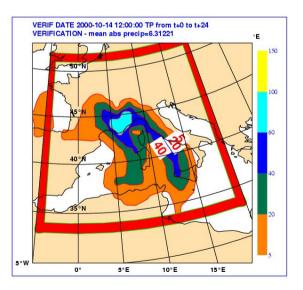

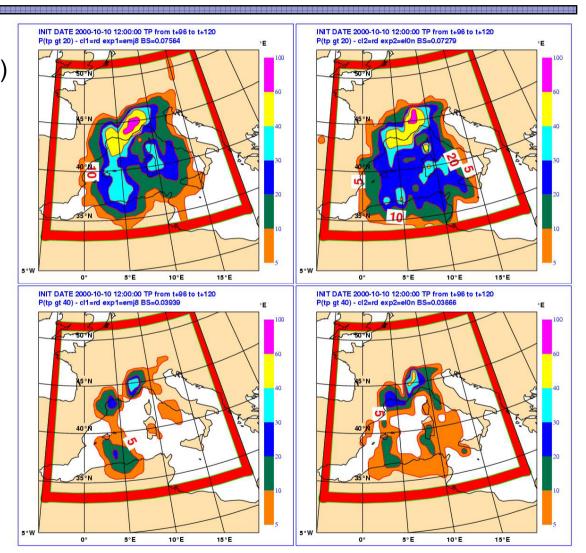

2. Flood of Oct 2000: PR(TP24>thr) in +120h forecasts

Panels to the right: t+120h forecasts of PR[TP24>20mm] (top) and PR[TP24>40mm] (bottom) started at 12Z of 10 Oct in the T255 (left) and VAREPS (right) ensembles. The bottom panel shows precipitation verification defined as the T511 t+24h TP.

- Intense precipitation over Europe (15 Oct 2000 and 12 Aug 2002)

3. The future: a seamless ensemble system from day 0 to day 32

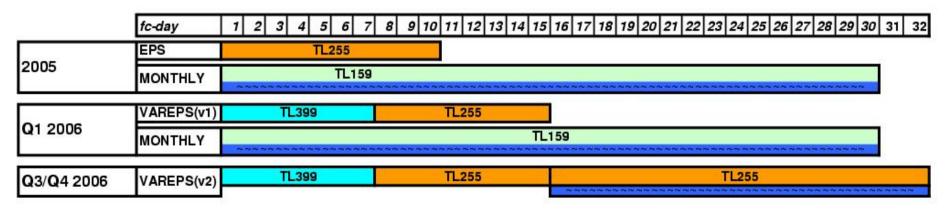

3. The future

Research tests of VAREPS have been completed successfully, and all required code modifications have been inserted in the new model cycle (30R1)

VAREPS is expected to be implemented in Q1/2006: the exact date will depend on progress on the high-resolution e-suite

It has not yet decided whether to upgrade the EPS in one step, from T255L40(d0-10) to VAREPSL62(d0-15), or in two steps, first from T255L40(d0-10) to T399L62(d0-10), and then to VAREPSL62(0-15)

In 2006 work to test linking VAREPS(d0-15) with the monthly forecast system will continue, with the goal to implement a seamless d0-32 VAREPS by the end of the year
