

Operational Short-Term Flood Forecasting for Bangladesh:

Application of ECMWF Ensemble Precipitation Forecasts

Tom Hopson Peter Webster

**Climate Forecast Applications for Bangladesh (CFAB):
USAID/CU/GT/ADPC/ECMWF**

The Climate Forecast Applications Project CFAB

- Bangladesh at confluence of: Meghna, Brahmaputra and Ganges
- Limited upstream river discharge data provided to Bangladesh
- However, good quality border daily discharge measurements
=> utilize in forecasting

CFAB's GOAL: Provide operational upper catchment flood-stage discharge warning and precipitation forecasts at differing time-scales

Overview:

Short-term flood forecasting

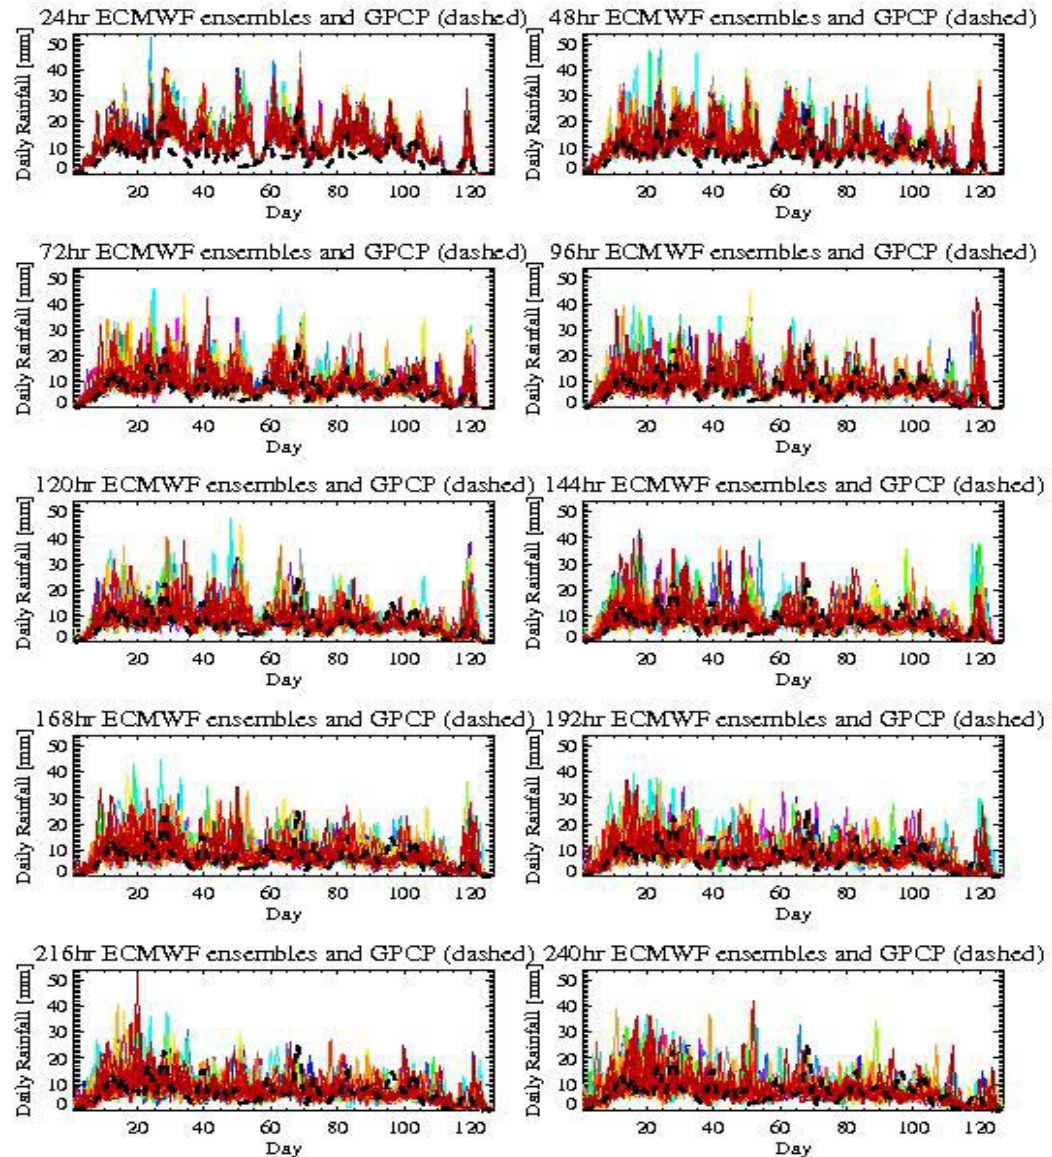

1. Multi-Model Ensemble Discharge Forecasting: Combining Data-Based and Distributed Modeling Techniques
2. “Dressing” Precipitation-derived Discharge Ensembles with Model Error Estimates: “Truer” Discharge Probabilities
3. Conclusions, and Future Work

Ganges catchment-averaged ECMWF 51 member 1-10 day Precipitation Forecasts

-- comparisons to the Global
Precipitation Climatology
Project (GPCP) precipitation
estimates

- GPCP and CMORPH used
as “truth”
=> used to calibrate models
=> initializes soil-moisture
- bias and spread corrections
of ECMWF “catchment-
averaged” forecasts done
similar to Hamill and
Colucci, 1997

Average Daily Accumulated Rainfall Over the Ganges
Daily GPCP Precipitation Estimates compared with
1 to 10-day Ensemble Forecasts, Days June 11 - October 15, 2003

Discharge Multi-Model-Ensemble

Krishnamurti (2001): combining (via regression) multiple NWP model outputs significantly improves weather forecasts => apply to 2 discharge models to generate 'multi-model-ensemble' discharge forecasts

Data-Based Modeling (Beven, 2002)

-- Linear Store / Linear Transfer Function Approach.

- Benefits: recalibrate to specific conditions => ;
maximizes data-assimilation (discharge measurements)
- Drawbacks: basin lumped model; limited slow time-scale response

Distributed Model (US NWS River Forecast System)

-- subcatchment gridded 2 soil-layer model

- Benefits: ET/soil-storage/water-balance explicitly modeled
- Drawbacks: Model recalibration and data-assimilation inflexible

Discharge Multi-Model Ensemble

(cont)

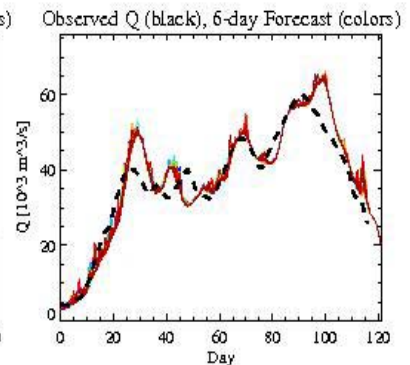

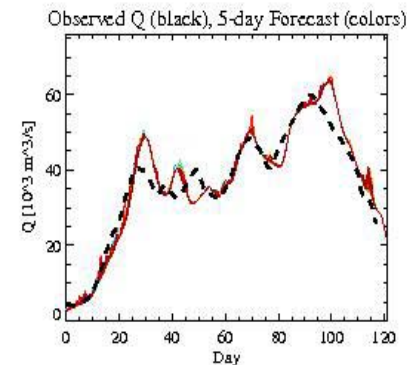

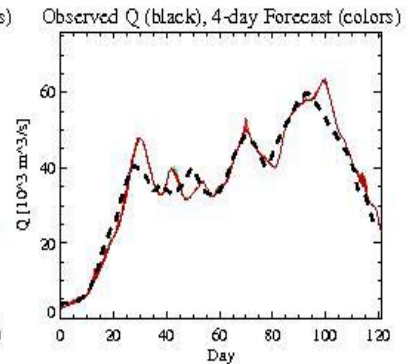

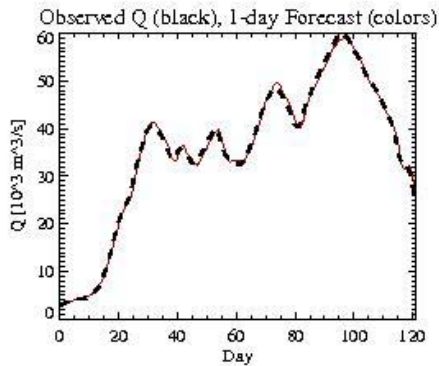

Multi-Model-Ensemble Approach:

- Rank models based on historic residual error using current model calibration and “observed” precipitation
- Regress models’ historic discharges to minimize historic residuals with observed discharge
- To avoid over-calibration, evaluate resultant residuals using Akaike Information Criteria (AIC)
- If AIC minimized, use regression coefficients to generate “multi-model” forecast; otherwise use highest-ranked model => “win-win” situation!

Model Comparisons for the Ganges

TFM Ganges Discharge Forecasts
1-6 day using ECMWF Precipitation Forecasts
June 15 - October 15, 2003

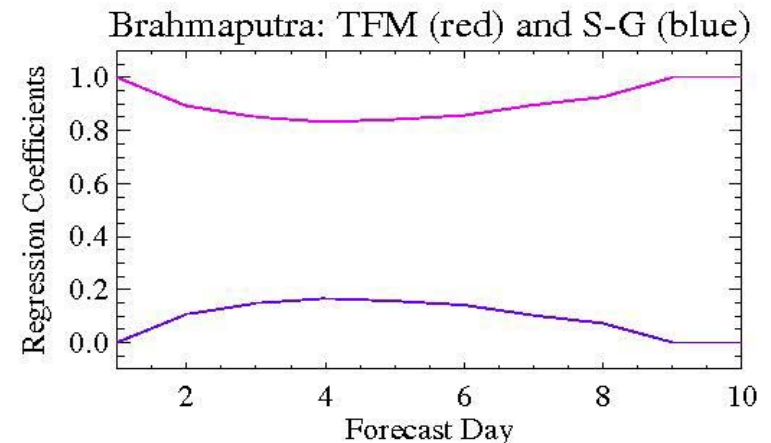

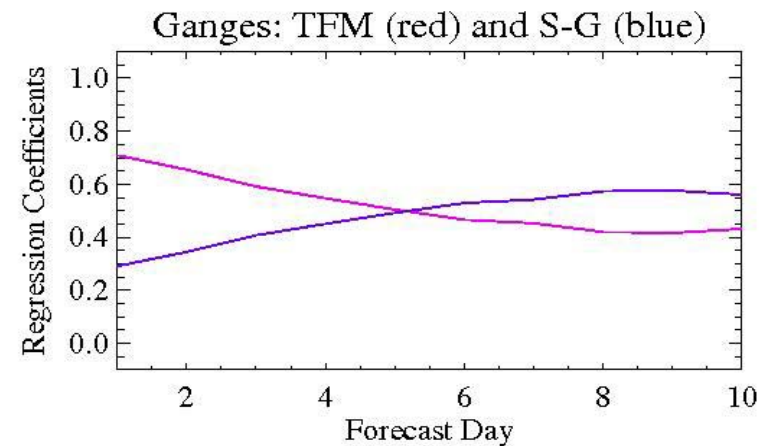

Distributed S-G Ganges Discharge Forecasts
1-6 day using ECMWF Precipitation Forecasts
June 15 - October 15, 2003

Multi-Model Ensemble Regression Coefficients

- DBM-TFM model (red)
- Distributed Model (blue)
- Significant catchment variation
- Coefficients vary with the forecast lead-time
 - ⇒ Representative of the
 - ⇒ each basin's hydrology
 - ⇒ -- Ganges slower time-scale response
 - ⇒ -- Brahmaputra "flashier"

Super-Ensemble Discharge Forecast Coefficients
for 1-10 day TFM and Distributed S-G Forecasts
Monsoon Seasons 1997 - 2003

Multi-Model Ensemble Forecasts

Results:

- show improvements
- but compromise timing (distributed) with amplitude (DBM)
 - => use of different error measure in selection process

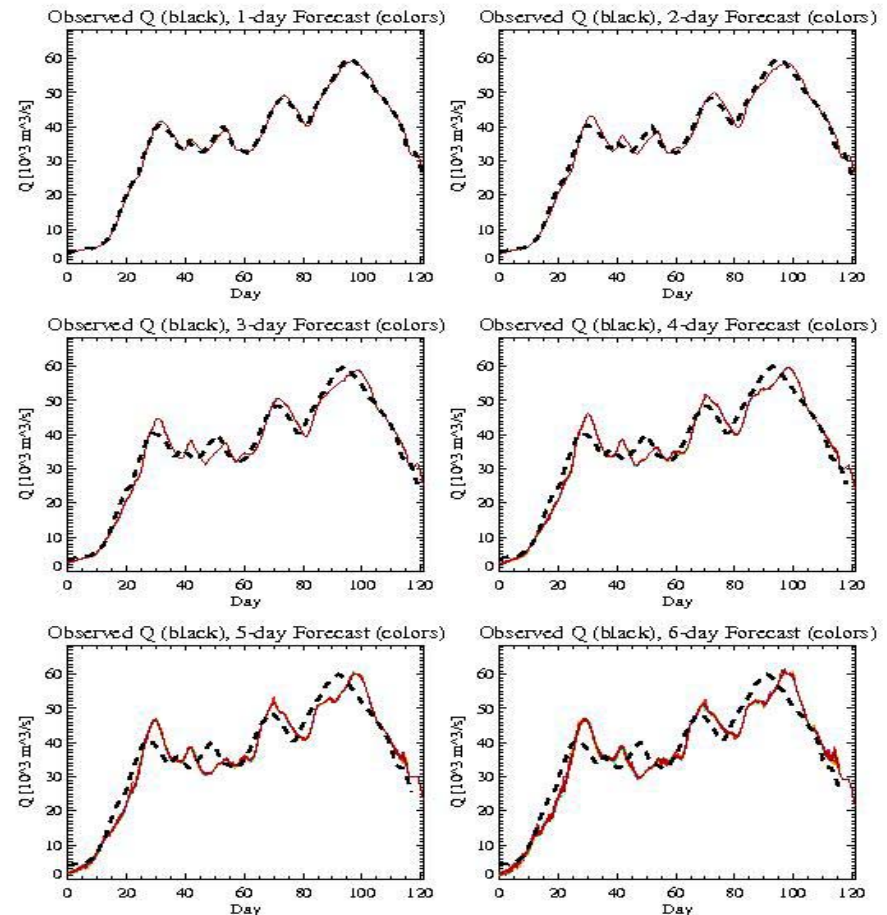

Future:

- structure allows incorporating other models – MMS/PRMS
- KNN technique to select based on current precipitation/discharge conditions

Super-Ensemble Ganges Discharge Forecasts

1-6 day using ECMWF Precipitation Forecasts

June 15 - October 15, 2003

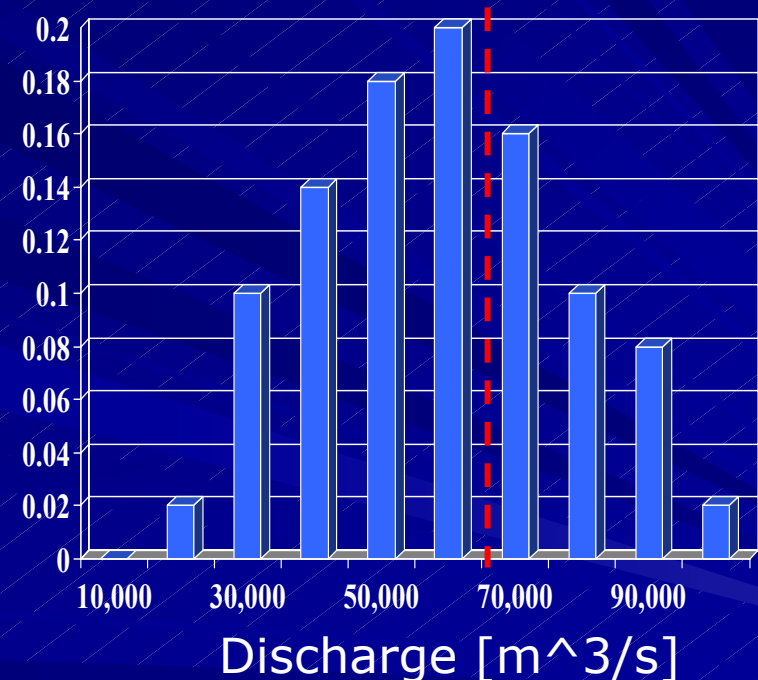

Combining Precipitation (Ensemble) Probability with Model Error: Forecasting “Truer” Discharge Probabilities

Rainfall Probability

Discharge Probability

Above danger level probability 36%
Greater than climatological seasonal risk?

A More Complete Discharge Probability Forecast

Step 1: generate model error PDF

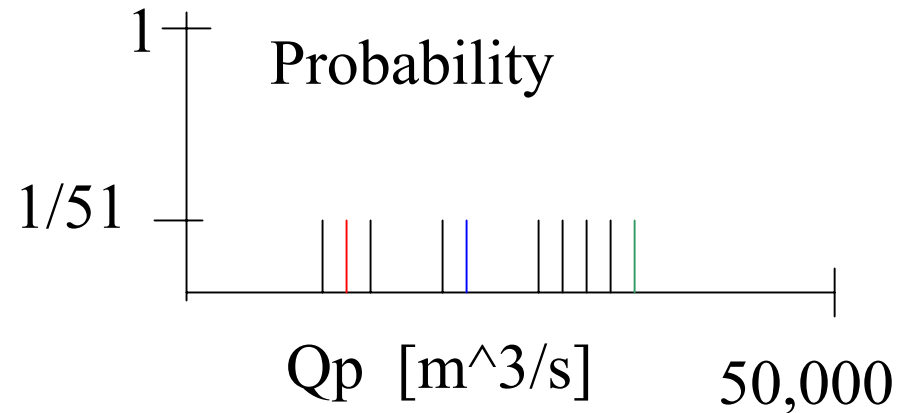

(discharge model/rating curve/observed precipitation)

- historically generate residual time series for each day's re-calibrated hydrologic model (multi-model) using “observed” precipitation
- use K-Nearest-Neighbor (KNN) technique to select “nearest-neighbor” residuals (selection: values/slope/curvature)
- use Mahalanobis Distance to weight and create model-error PDF

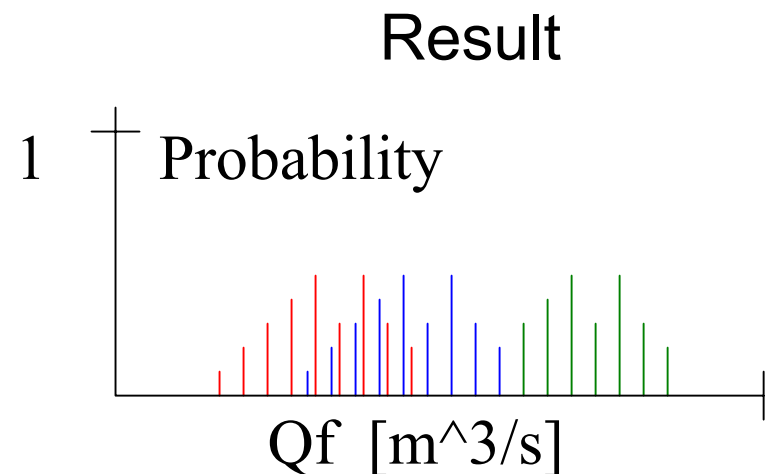

Combining Model / Precipitation Error (cont)

Step 2: generate precipitation-ensemble-generated discharge PDF

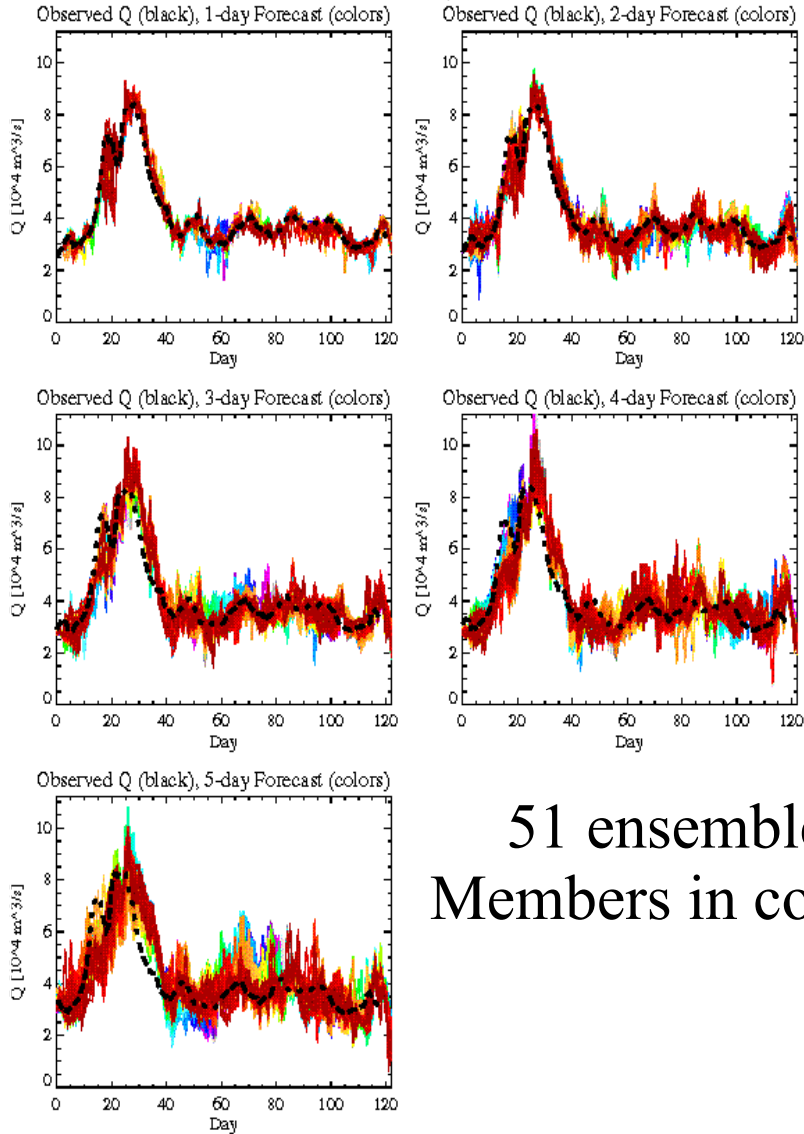

Step 3: combine model error PDF with the above to generate a “new-and-improved” more complete PDF for forecasting:

Brahmaputra Discharge

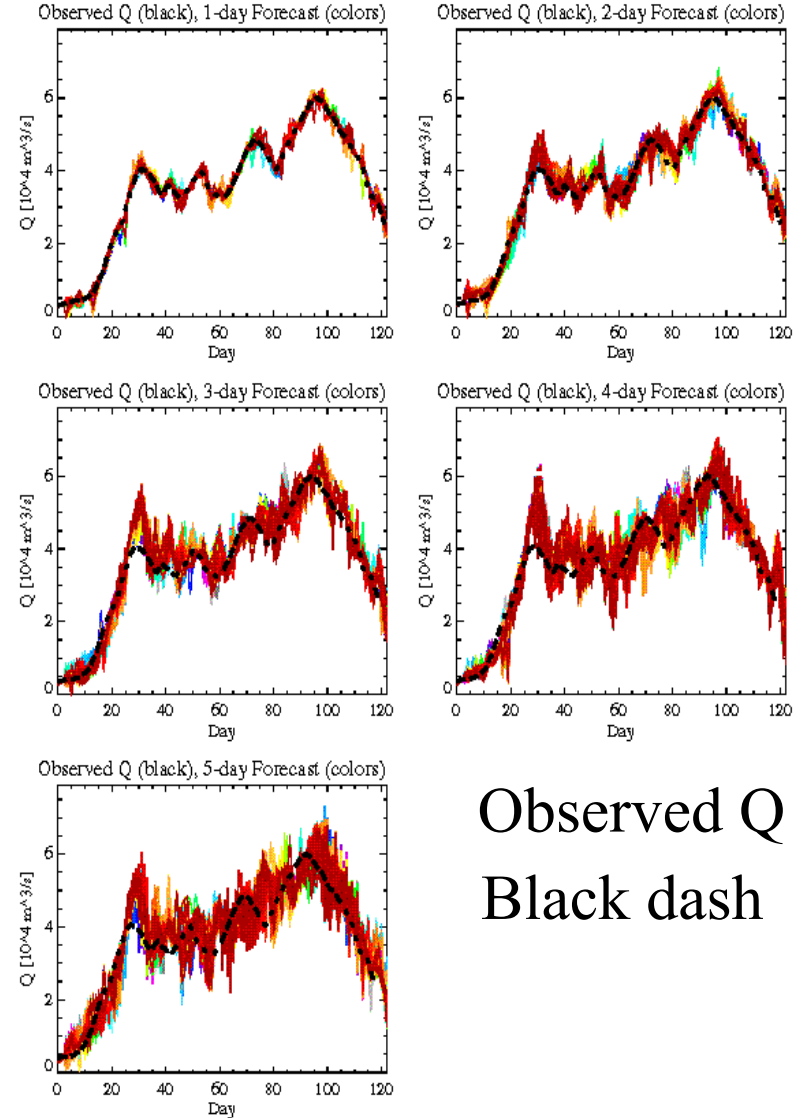

June 15 - October 15, 2003

51 ensemble
Members in color

Ganges Discharge

June 15 - October 15, 2003

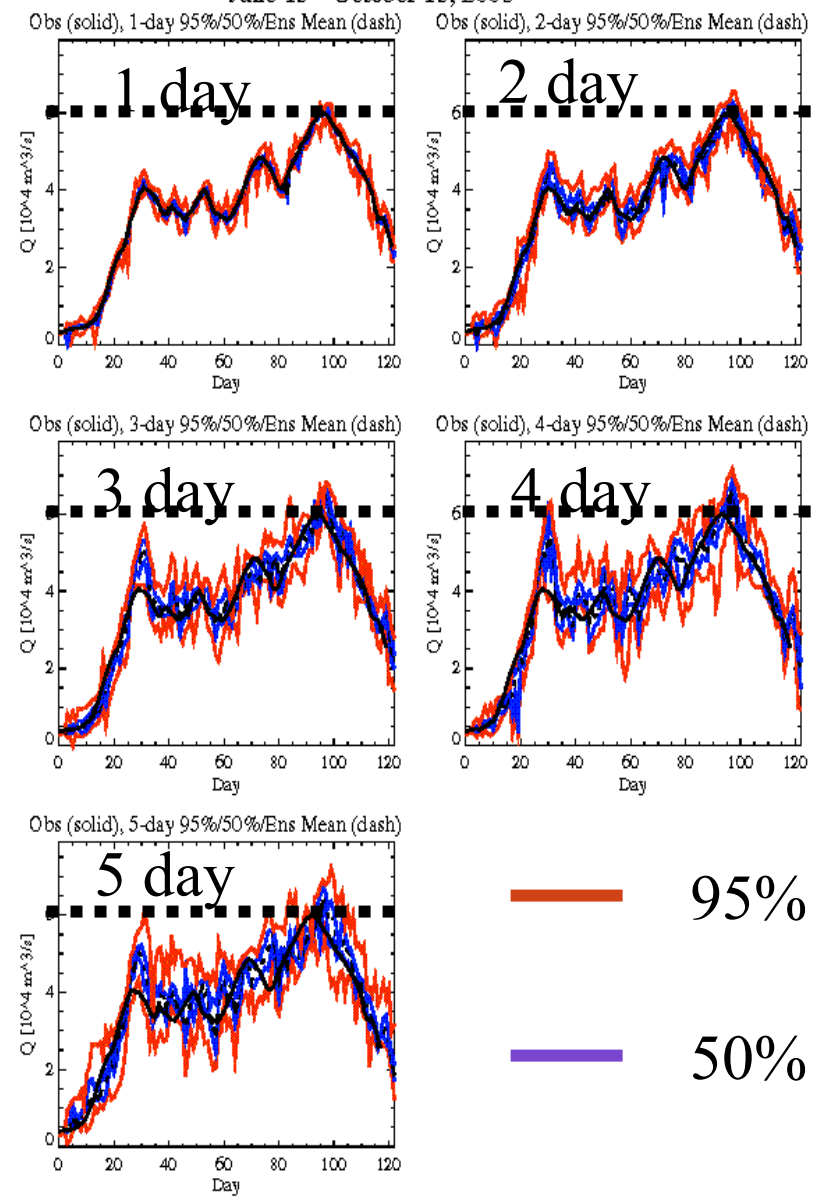

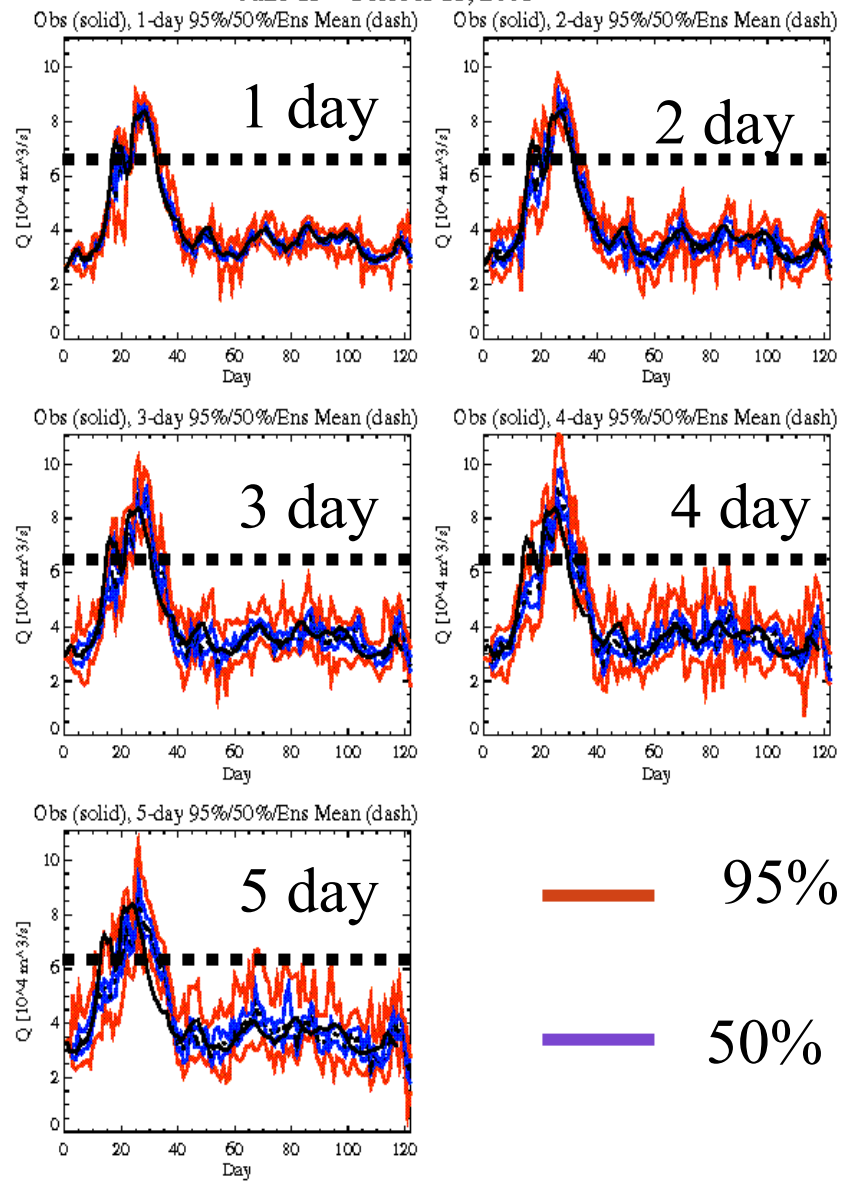

Observed Q
Black dash

Brahmaputra Flood Probability

Ganges Flood Probability

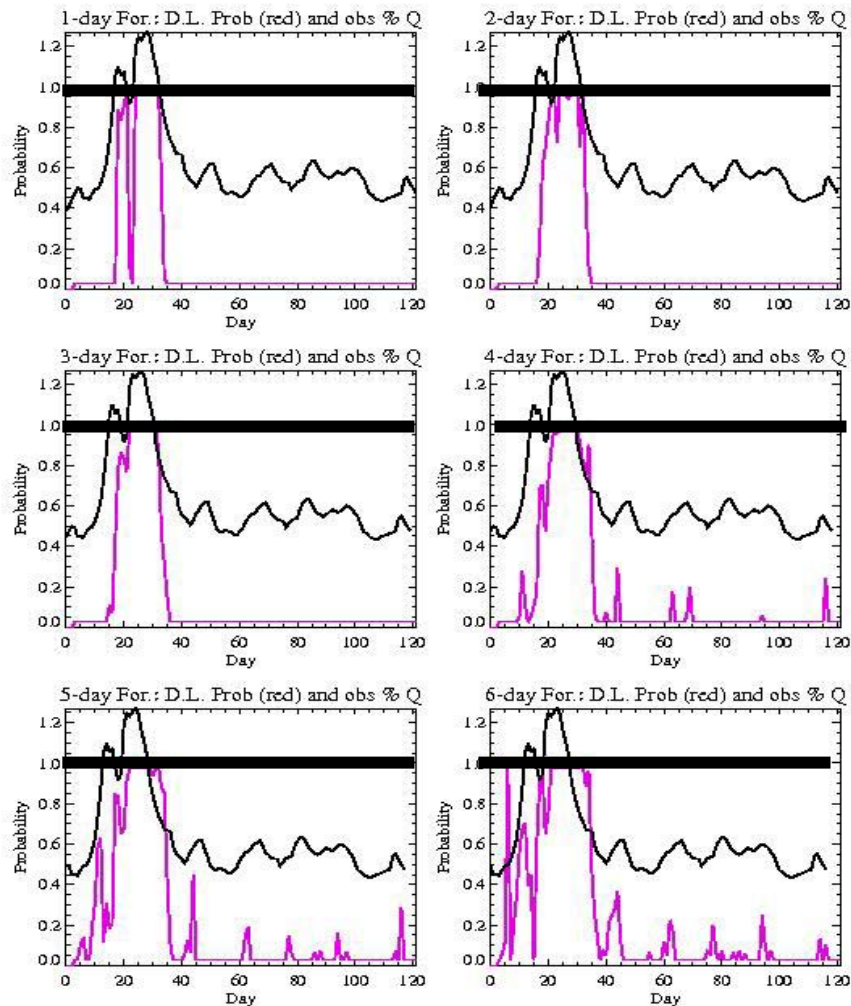

June 15 - October 15, 2003

June 15 - October 15, 2003

Danger Level Probabilities

Brahmaputra Distributed S-G Danger Level Probabilities
1-6 day using ECMWF Precipitation Forecasts
June 15 - October 15, 2003

Ganges Distributed S-G Danger Level Probabilities
1-6 day using ECMWF Precipitation Forecasts
June 15 - October 15, 2003

Conclusions

- Incorporated operationally into Bangladesh flood warning program
- Forecasts based on ECMWF 51-member forecasts and “observed” near-real-time precipitation estimates
- Shows good skill out to 5-7 days (“useful” skill out to 10-days)
- Extends Bangladeshi forecasts to 7-9 days

Future Work: combine ECMWF EPS precipitation with longer time-scale statistical-derived precipitation forecasts for a “seam-less” extension
