

GRAS SAF Workshop on Applications of GPS Radio Occultation Measurements

ECMWF Reading, UK; 16-18 June 2008

# Climate Signal Detection with GPS Radio Occultation Measurements

(focus trend signal detection, mainly based on GPS/Met and CHAMP radio occultation records 1995-1997 and 2001-2008)

G. Kirchengast<sup>1</sup>, A.K. Steiner<sup>1</sup>, U. Foelsche<sup>2,1</sup>, B.C. Lackner<sup>3,1</sup>, B. Pirscher<sup>1</sup>, and M. Borsche<sup>1</sup>

(1) WegCenter & IGAM, Univ. of Graz, Graz, Austria
(2) UCAR/COSMIC, Boulder, CO, USA
(3) Univ. of Edinburgh, Edinburgh, UK

Thanks for funds to

- Radio Occultation (RO) method and properties (just to have an intro included, essentially skipped in the talk)
- RO data set and climatologies
- On uncertainties and consistency of climatologies
- Climate trend signal detection study design
- Trend, error, and uncertainty calculations
- Results and discussion
- Conclusions and outlook

# **Radio Occultation Principle**

#### **GNSS–LEO** satellite constellations

#### allow

- radio occultation observations in an active limb sounding mode exploiting the
- atmospheric refraction of GNSS signals providing
  - measurements of phase path delay for the retrieval of
  - key atmospheric/climate parameters
    - e.g., refractivity N,
    - geopotential height Z,
    - temperature T, humidity q

Courtesy: U. Foelsche

# **Retrieval of Atmospheric Variables**

# **RO Data Characteristics**

## **Properties**

- Global coverage
   ~250 RO events/day →
   130–180 atmospheric profiles/day
- Essentially all weather capability
- High accuracy and high vertical resolution in the Upper Troposphere and Lower Stratosphere (UTLS) (~8-30 km)
- Long-term stability due to intrinsic self-calibration, precise timing with atomic clocks
- Homogeneity and consistency despite very different orbits, different instruments & raw processing chains

**Atmospheric temperature profile** 50 km miles Stratosphere 8 100 Pressure (hPa) miles / 10 km **Froposphere** 500 700 850 1000 32 68 -40 -20 0 20 °C

# **RO Mission GPS/Met**

#### GPS Receiver onboard CHAMP

## **CHAMP RO data record**

### **CHAMP:** First opportunity for multi-year RO climatologies

# **RO based Climatologies**

## **Event Distribution and Dry Temperature Climatologies** Example Months – February/October 2004

 WegCenter Retrieval CCRv2.3, OPSv5.2/v5.3 Phase & orbit data from GFZ Potsdam Monthly mean fields Zonal mean fields Binning and Averaging 36 latitude bands 5° latitudinal width Background bending angle data for statistical optimization: ECMWF analyses for CHAMP (T42L60, T42L91) ERA-40 for GPS/Met (T42L60)

## (on uncertainties and consistency of climatologies...) Systematic Difference – Summer

## **Systematic Difference – JJA2006**

February 2006: Major change at ECMWF

Horizontal Resolution: T511  $\rightarrow$  T799

Vertical Resolution:

tion:  $L60 \rightarrow L91$ 

Top model level:

0.1 hPa → 0.01 hPa

![](_page_10_Figure_10.jpeg)

Tropical Tropopause differences disappeared

Wave-like bias structure now over the Arctic

![](_page_11_Picture_0.jpeg)

## Systematic Difference – JJA 2007

![](_page_11_Picture_2.jpeg)

as of December 2006: Assimilation of RO data at ECMWF

![](_page_11_Figure_4.jpeg)

![](_page_12_Picture_0.jpeg)

## Systematic Difference – JJA 2007

![](_page_22_Picture_0.jpeg)

# Signal Detection Setting the Scene: 1995–2007 Atmospheric Variability

![](_page_22_Picture_2.jpeg)

#### **Internal climate variability**

![](_page_22_Figure_4.jpeg)

#### **Solar variability**

![](_page_22_Figure_6.jpeg)

#### Within data-covered time periods:

- No relevant volcanic eruption
- No major El Niño/La Niña events
- No high solar activity; F10.7 indices ~60–160, wrt ionospheric variability

![](_page_23_Picture_0.jpeg)

## Climate Trend Signal Detection Study Design

![](_page_23_Picture_2.jpeg)

- Questions: Is a significant trend detectable in available RO data? Does the observed trend exceed inter-annual variability? Does the observed trend exceed natural trend variability?
- GPS/Met and CHAMP dry temperature climatologies: *T*dry(*p*) zonal monthly means for February and October
- Timeframe: October 1995 and 2001–2006 (7 yrs with data, 12 yrs in total) February 1997 and 2002–2007 (7 yrs with data, 11 yrs in total)
- Regions: Tropics (20°S-20°N) NH Extratropics (20°N-50°N)
  - SH Extratropics (20°S-50°S)
- Pressure/Altitude Layers: UTLS within 300–30 hPa (~9–25 km)

Lower Stratosphere LS (100–30 hPa)

Tropopause TP (200–100 hPa)

Upper Troposphere UT (300-200 hPa)

Currently record extended to 2008

• Additional analysis for finer resolution: 5 regions and

5 pressure levels (300, 200, 100, 50, 30 hPa)

![](_page_24_Picture_0.jpeg)

## **Calculations of Measurement Errors**, **Trends, and Uncertainties**

![](_page_24_Picture_2.jpeg)

#### RO measurement errors:

e<sub>samp</sub> (estimated using ECMWF analyses "True" profiles at the RO Sampling error: locations minus "True" mean field)

Observation error:  $e_{obs} = 1$ K/sqrt(N), N...Number of RO profiles, 1K for individual profile Systematic error:  $e_{svs} = 0.2 \text{ K} \le 100 \text{ hPa}, 0.1 \text{ K} > 100 \text{ hPa}$  (Gobiet et al., 2007)

Total error:

Pototal 
$$e_{ROtotal} = \sqrt{(e_{samp})^2 + (e_{sys})^2 + (e_{obs})^2}$$

• Linear Trend:  $\delta T$  least-squares fit considering  $s_{ROtotal}$  for each individual month

• **Uncertainties:** Uncertainty of the trend:  $s_{\sigma\tau}$ 

Inter-annual variability of inspected period – de-trended StDev:  $s_{97-07,}$ ,  $s_{95-06}$ 

Natural climate trend variability: *s*<sub>NatVar</sub> multi-century pre-industrial control runs

e,

$$s_{NatVar} = \frac{1}{N} \sum_{i=1}^{N} s_i^{gcr}$$

estimated based on

of 3 representative global climate models for IPCC AR4 (ECHAM5+HadCM+CCSM3)

- Signal-to-Noise Ratio SNR: Signal/ Interannual Variability: Signal/ Natural Trend Variability:
- Significance: Students t-test

$$SNR_{(s_{\delta T} + s_{97-07})} = \frac{\delta T}{\sqrt{s_{\delta T}^{2} + s_{97-07}^{2}}}$$
$$SNR_{(s_{\delta T} + s_{NatVar})} = \frac{\delta T}{\sqrt{s_{\delta T}^{2} + s_{NatVar}^{2}}}$$

![](_page_25_Picture_0.jpeg)

## **Trend Differences** *T*<sub>phys</sub>–minus–*T*<sub>dry</sub>, **Feb 1997-2007** (estimated based on ECMWF analyses)

![](_page_25_Picture_2.jpeg)

![](_page_25_Figure_3.jpeg)

![](_page_26_Picture_0.jpeg)

## **RO Temperature Trends and RO Data Errors** February

Year

![](_page_26_Picture_2.jpeg)

![](_page_26_Figure_3.jpeg)

Temperature anomalies (left) wrt 2002–2006 mean with individual total RO error

- Max Total RO error: 0.98K Feb97 Component errors (right):
- Sampling error: max 0.97 K Feb97 dominant for GPS/Met and in NHE
- Observation error: ~0.05 K

• Systematic error: 0.2 K in LS 0.1 K in UT, TP dominant error source in tropics

![](_page_27_Picture_0.jpeg)

## RO Temperature Trends and RO Data Errors October

![](_page_27_Picture_2.jpeg)

![](_page_27_Figure_3.jpeg)

Temperature anomalies (left) wrt 2002–2006 mean with individual total RO error

- Max Total RO error: ~0.8K Oct01 Component errors (right):
- Sampling error: max ~0.8 K Oct01 dominant for GPS/Met in NHE/SHE and for CHAMP in SHE
- Observation error: ~0.05 K
- Systematic error:
   0.2 K in LS
   0.1 K in UT, TP
   dominant error in tropics, NHE LS

![](_page_28_Picture_0.jpeg)

## RO Temperature Trends vs Key Uncertainties δtrend, interann.var, nat.var

![](_page_28_Picture_2.jpeg)

![](_page_28_Figure_3.jpeg)

Significant 11-yr trend in Feb in UT & LS over natural and inter-annual variability

![](_page_28_Figure_5.jpeg)

orange: > 95% significance level yellow: > 90% significance level

![](_page_29_Picture_0.jpeg)

## Discussion: Comparison to Trends from GCM runs and Radiosonde Data

![](_page_29_Picture_2.jpeg)

RO: 1995/97 GPS/Met, 01/02-06/07 CHAMP; HadAT2: Raobs climate dataset/ same years; GCM runs: IPCC AR4 A2 and B1 scenario runs of ECHAM5+HadCM+CCSM3, 11-yr trends sampled from 2001-2020 period

![](_page_29_Figure_4.jpeg)

Agreement within uncertainty estimates in February between RO, Raobs, GCMs

![](_page_29_Figure_6.jpeg)

Agreement within uncertainty estimates in October in UTLS

![](_page_30_Picture_0.jpeg)

## **Discussion: QBO**

![](_page_30_Picture_2.jpeg)

#### **Quasi-Biennial Oscillation QBO**

- pattern in tropical lower stratosphere with a period of ~28 months
- seasonal changes in radiative heating due to dissipation of vertically prop. waves
- downward propagating wind/temperature anomalies
- constrained to  $5^{\circ}N-5^{\circ}S$  and to vertical layer of ~16–22 km
- T-anomalies of up to  $\pm$ 6 K at ~16–30 km, at tropopause decrease to <  $\pm$ 0.5 K

![](_page_30_Figure_9.jpeg)

Estimated contribution from QBO – mean over tropical region (20°N–20°S) and over vertical layer of ~16–25 km: < 0.5 K in standard deviation (LS Trend still significant)

![](_page_31_Picture_0.jpeg)

# **Conclusions and Outlook**

![](_page_31_Picture_2.jpeg)

- Given available monthly GPS/Met and CHAMP RO records within October 1995 and 2001-2006 / February 1997 and 2002-2007 we addressed the following signal detection questions: Is a trend detectable exceeding inter-annual variability in Oct95-06 or Feb97-07? Is a trend detectable exceeding natural trend variability estimated from preind.ctrl.?
- A significant warming/cooling trend, relative to noise and to natural variability, was found in February in the tropical UT/LS.
- Comparison with trends from HadAT2 RAOBs climate data showed agreement within uncertainty estimates in February; GCMs agree in envelope as well (though the bulk shows less warming/cooling contrast across the tropical tropopause)
- Discussion of QBO contribution estimate suggests minor influence to trend significance in LS
- Ongoing work includes the quantitative estimation of the QBO contribution from RO data, the extension of the trend estimates to Oct07 and Feb08, respectively, the re-check of GPS/Met data processing, the cross-check of use of either GFZ or UCAR phase delay and orbital data, the consistency with COSMIC, and more...

![](_page_32_Picture_0.jpeg)

# **Conclusions and Outlook**

![](_page_32_Picture_2.jpeg)

- Given available monthly GPS/Met and CHAMP RO records
  within October 1995 and 2001-2006 / February 1997 and 2002-2007
  we addressed the following signal detection questions:
  Is a trend detectable exceeding inter-annual variability in Oct95-06 or Feb97-07?
  Is a trend detectable exceeding natural trend variability estimated from preind.ctrl.?
- A significant v found in Febr
- Comparison v within uncerta the bulk show
- Discussion of significance in
- Ongoing work RO data, the

RO data it is exciting times that have recently started for climate signal detection based on this unique data source in terms of accuracy, consistency, and long-term stability; promises of around twenty years ago are more and more confirmed by real data...
