

# HIGH-RESOLUTION EFFORT

**Yuhei Takaya**

Climate Prediction Division  
Japan Meteorological Agency

From IPCC Fourth Assessment Report: Climate Change 2007  
<http://www.ipcc.ch/>

# Outline

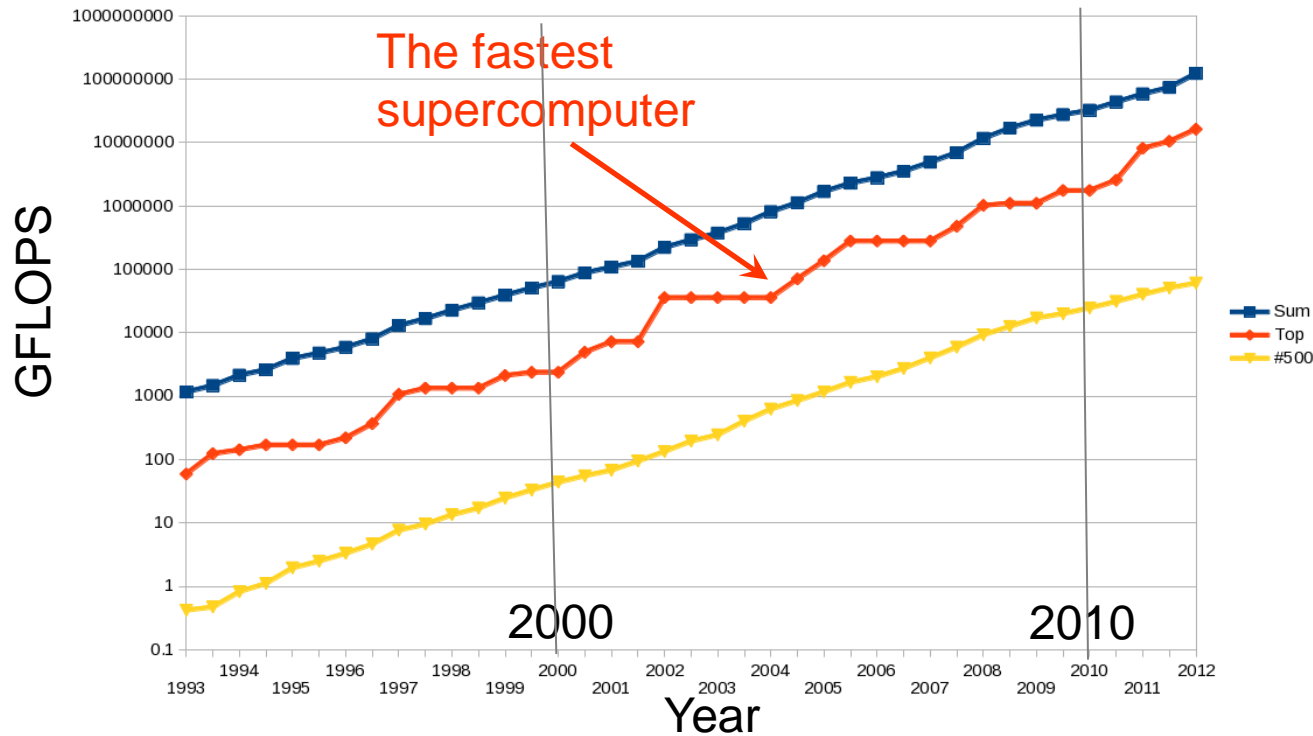

- Current status of model resolution for operational seasonal prediction
- Prospects from high-resolution modelling
  - Processes to be resolved / improved with high-resolution models
- Some efforts and approaches for high-resolution seasonal prediction
- Summary

**Current status of model  
resolution for operational  
seasonal prediction**

**HITACHI SR16000 (JMA's HPC June 2012-)**

# Growth of supercomputers' performance

GPU-based & cluster HPCs increased.

Reducing horizontal grid spacing by a factor of 10 requires a factor of  $10^3$  increase of computational power.

**Growth of supercomputers' performance**, based on data from **top500.org** site (<http://i.top500.org/>). The y-axis shows performance in GFLOPS. The red line denotes the fastest supercomputer in the world at the time. From Wikipedia: <http://en.wikipedia.org/wiki/TOP500>.

# Model resolution of CGCM (JMA)

## 2013? JMA/MRI-CGCM2

Atm: **T<sub>L</sub>159** (~110 km, 1.125 deg.) L60 (~0.1hPa)

Ocn: **1x1-0.3** L 53

## 2008 JMA/MRI-CGCM (2010- for Seasonal Fcst)

Atm: **T<sub>L</sub>95** (~180 km, 1.875 deg.) L40 (~0.4hPa)

Ocn: **1x1-0.3** (30N-30S) L51 (top: ~1m)

## 2003 JMA-CGCM02 (GSM0103) \*

Atm: **T63** (~180 km, 1.875 deg.) L40 (~0.4hPa)

Ocn: **2.5x2-0.5**(10N-10S) L20 (top: ~10 m)

## 1999 JMA-CGCM01 (GSM8911) \*

Atm: **T42** (~250 km) L21 (~10 hPa)

Ocn: **2.5x2-0.5**(10N-10S) L20

\* CGCM for ENSO prediction

# Model resolution of seasonal prediction (ECMWF)

## 2011 System 4 (IFS Cy36r4, NEMO)

Atm: T<sub>L</sub>255 (~80 km, 0.7 deg.) L91 (~0.01hPa)

Ocn: 1x1-0.3 deg. L42, 51M

## 2003 System 3 (IFS Cy31r1, HOPE)

Atm: T<sub>L</sub>159 (~125 km, 1.125 deg.) L62 (~0.5hPa)

Ocn: 1.4x1.4-0.3 deg. (30N-30S) L29 (top: ~10 m) , 41M

## 2001 System 2 (IFS Cy23r4, HOPE)

Atm: T<sub>L</sub>95 (~210 km, 1.875 deg.) L40

Ocn: 1.4x1.4-0.3 deg. (30N-30S) L29 (top: ~10 m)

## 1997 System 1 (IFS Cy15r8, HOPE)

Atm: T63 (~210 km) L31

Ocn: 2.8x2.8-0.5 deg. (10N-10S) L20

# Model resolution UK climate models

Table 1. Progression of UK climate models. (Standard versions are given in ordinary type. HadCM2, HadCM3 and HadGEM1 have contributed to the IPCC Assessment Reports. Those highlighted in bold are recent research developments to investigate the importance of resolution in the coupled ocean–atmosphere system.)

model	year	atmosphere		ocean		relative computing power

# What did hinder upgrades of resolution of seasonal prediction? (1)

- Seasonal prediction systems require a huge amount of re-forecasts (hindcasts) for verification and calibration.
- If we conduct a set of re-forecast: 15 members ensemble, 7 months integration, 12 cases per year, 30 years, then it requires...

30 yr x 12 cases x 15 mem x 7 mon

= **3150 years integration!**

# What did hinder upgrades of resolution of seasonal prediction? (2)

**Additional Components**

- Ocean
- Sea ice
- ...

**Ensemble size  
Longer reforecast**

...

# Increase of Ocean Model Resolution

**Eddy-resolving-resolution** ocean models drastically improve its performance in reproducing fine scale variabilities (meso-scale eddies, WBC, TIW) compared to **non-eddy-permitting-resolution**.

- **Non-eddy-permitting resolution (~1 deg.)**
  - The eddy effect (such as mixing) is parameterized (e.g., Gent and McWilliams 1990).
- **Eddy-permitting resolution (~0.25 deg.)**
  - Ocean eddies are partly represented.
- **Eddy-resolving resolution (~ 0.1 deg. )**
  - Ocean eddies are resolved.
  - Mixing and transports due to eddies are resolved, reproducing mean climate satisfactorily.

# GFDL CM 2.6 simulation

## Gulf Stream

- 100-200 km width
- One of the strongest current (western boundary current)

From GFDL/NOAA web site

[http://www.gfdl.noaa.gov/flash-video?vid=cm26\\_v5\\_sst&w=940](http://www.gfdl.noaa.gov/flash-video?vid=cm26_v5_sst&w=940)

# GFDL CM 2.6 simulation

## Tropical Instability Wave (TIW)

- Cusp-shaped instability wave just north of the equator in both the Pacific and Atlantic oceans
- 1000 - 2000 km, 20-40 days period
- Influence on ENSO variability

From GFDL/NOAA web site

[http://www.gfdl.noaa.gov/flash-video?vid=cm26\\_v5\\_sst&w=940](http://www.gfdl.noaa.gov/flash-video?vid=cm26_v5_sst&w=940)

# GFDL CM 2.6 simulation

## Kuroshio current

- 100 km width
- some times exceeds 2 m/s

From GFDL/NOAA web site

Jochum and Murtugudde  
(2006) , JPO

# ENSO and TIW

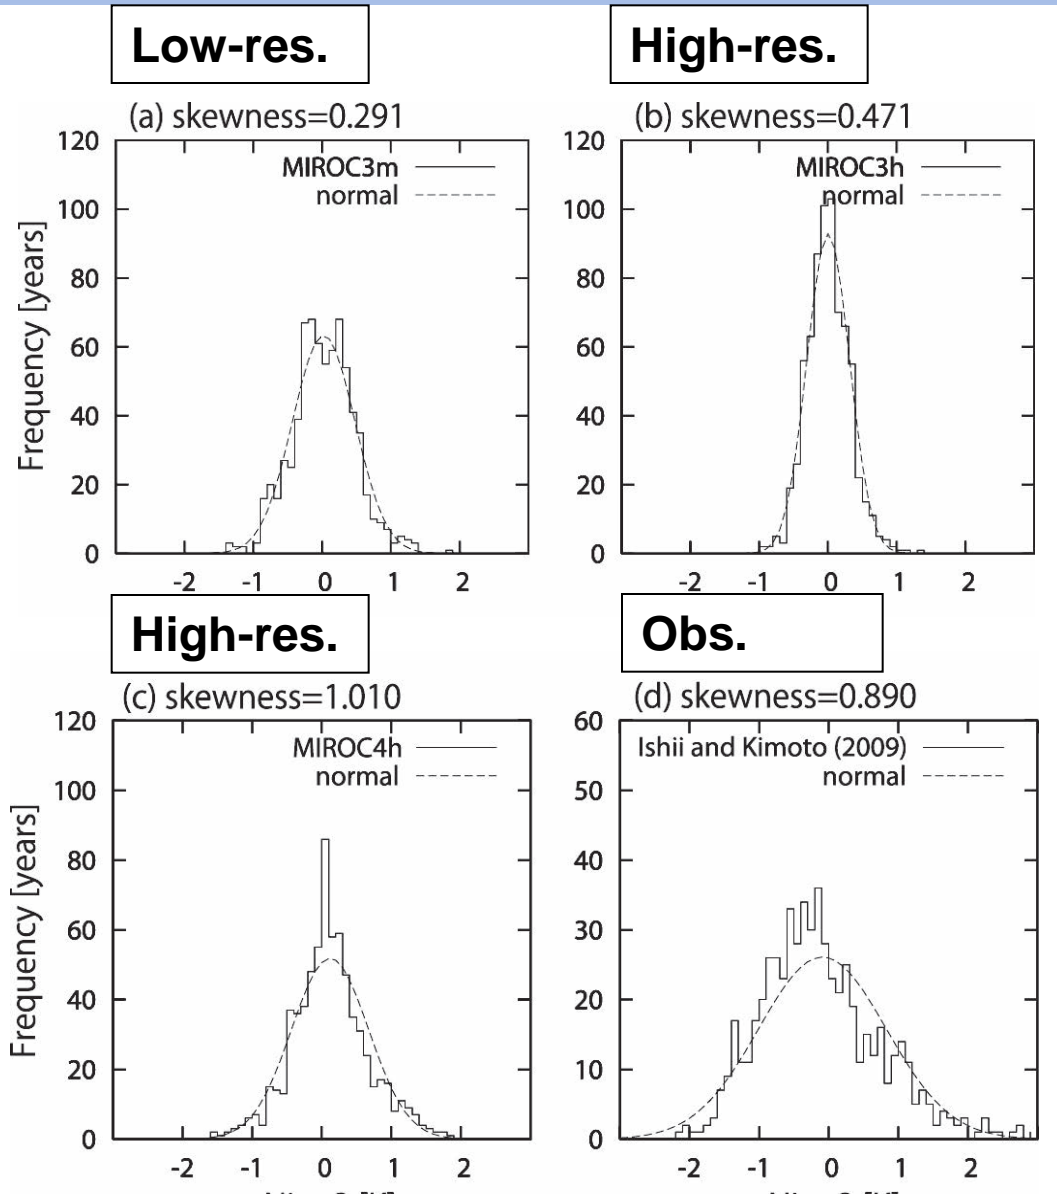

**Nino-3 indices from high-res., low-res. models and an observation.**

Sakamoto et al. 2012

cf. Imada and Kimoto (2012), An (2008)

# ENSO and TIW

Histograms of probability density distributions of Nino-3 indices from (a) MIROC3m, (b) MIROC3h, (c) MIROC4h, and (d) Ishii and Kimoto (2009). Dashed line shows a normal distribution. Skewness for each Nino-3 index is also noted.

Sakamoto et al. 2012  
cf. Imada and Kimoto (2012),  
An (2008)

# ENSO and TIW

High-res. model

Low-res. Model w/ TIW  
parameterization

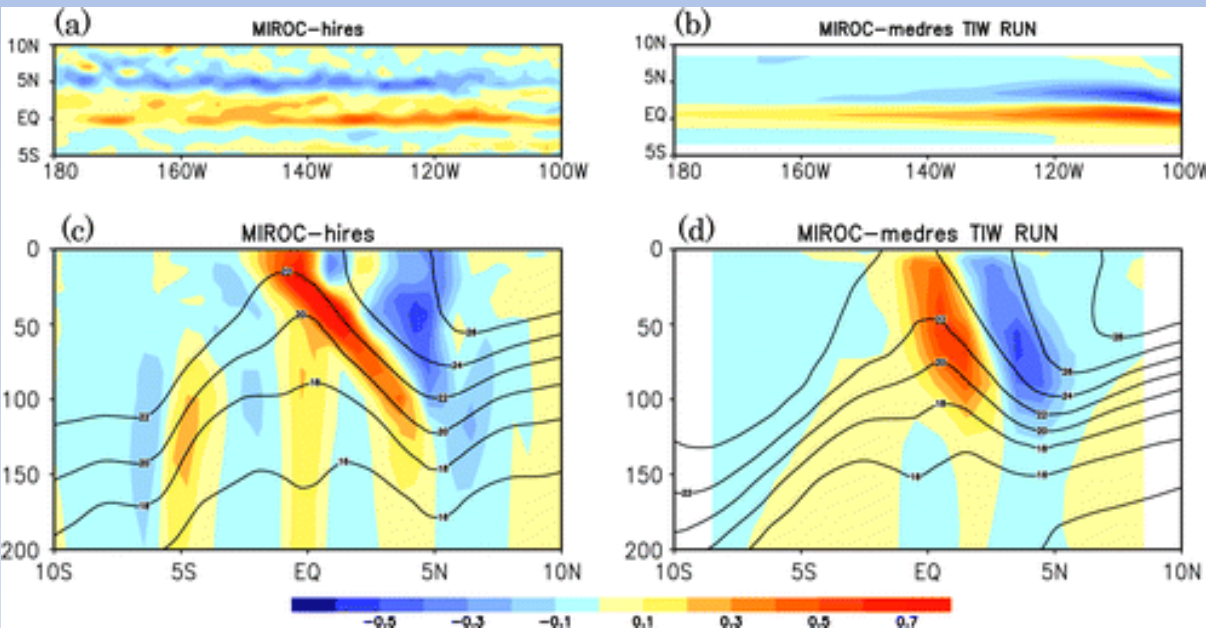

Imada and Kimoto (2010)  
introduced a new TIW  
parameterization.

(upper)

Horizontal eddy heat flux  
(averaged from the  
surface to 100 m depth)

(lower)

latitude–depth section (at  
 $120^{\circ}$  W) of meridional eddy  
heat flux convergence ( $1 \times 10^{-6}$   
 $\text{K s}^{-1}$ ).

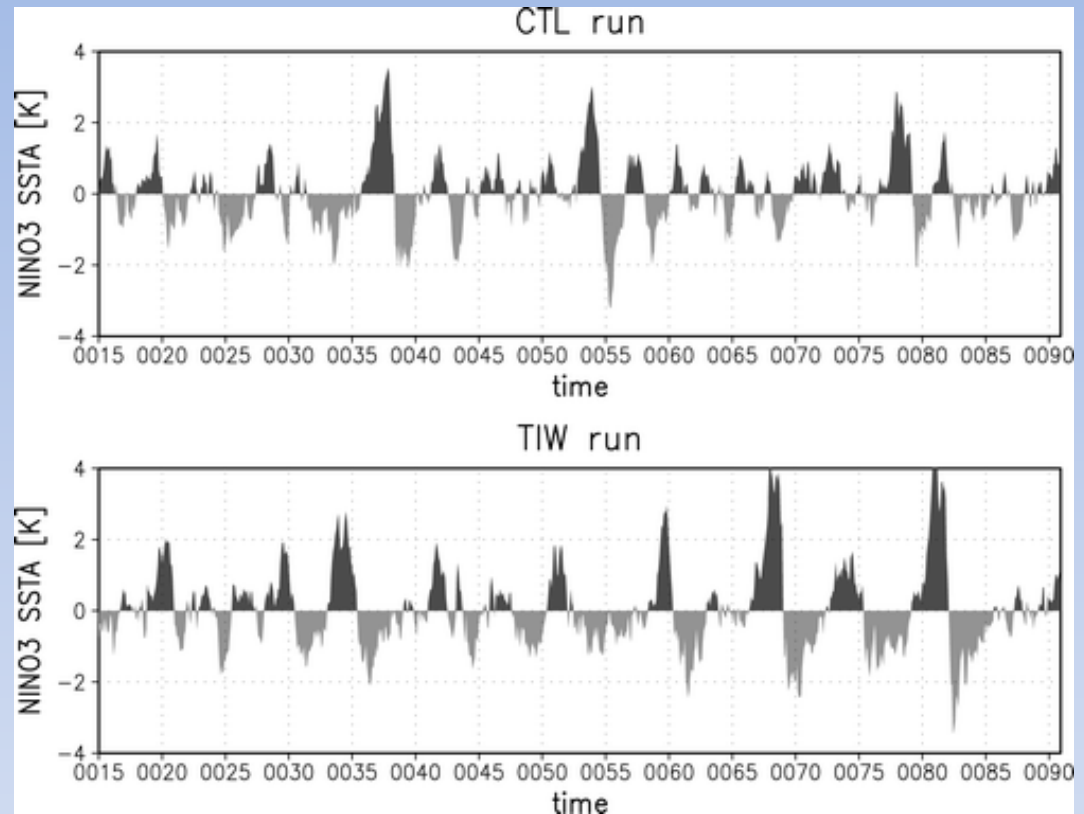

The results imply that nonlinearity of ENSO would be improved  
if the TIWs are parameterized or resolved in CGCMs.

Imada and Kimoto 2012 cf. Sakamoto et al. 2012

# ENSO and TIW

Time series of SST anomalies averaged over the Niño-3 region calculated from  
(top) Low-res. Model **w/o** TIW parameterization  
(bottom) Low-res. Model **w/** TIW parameterization.

The results imply that the El Niño–La Niña asymmetry would be improved if the TIWs are parameterized or resolved in CGCMs.

Imada and Kimoto 2012, cf. Sakamoto et al. 2012

# High-resolution atmospheric model for seasonal forecasting

Impacts of the atmospheric model resolution for the seasonal forecast has been of interest for long time.

Tibaldi et al. (1990) QJRMS

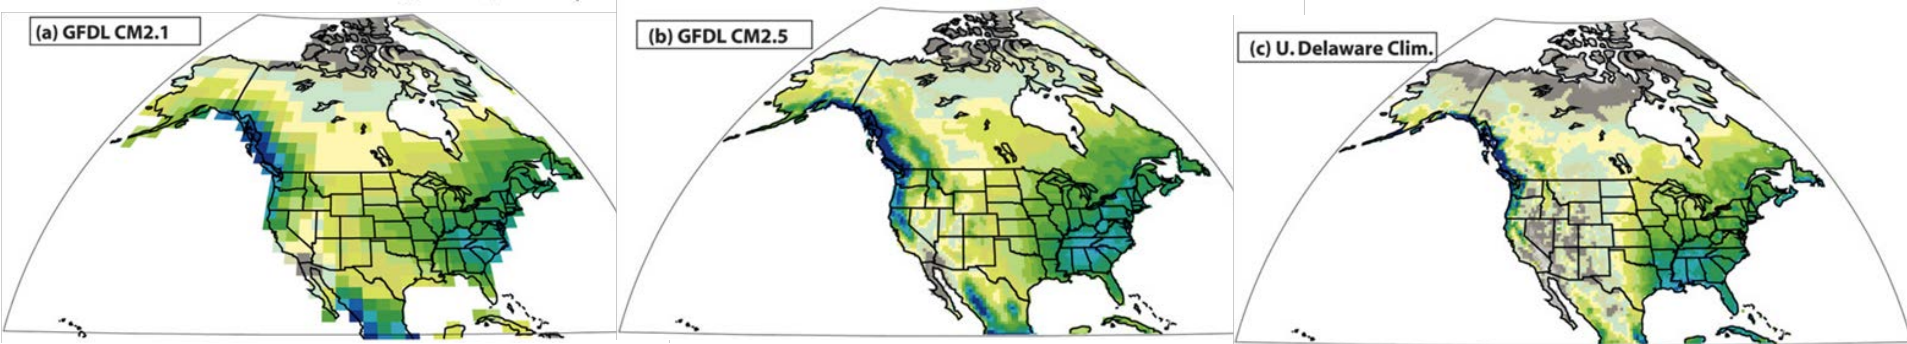

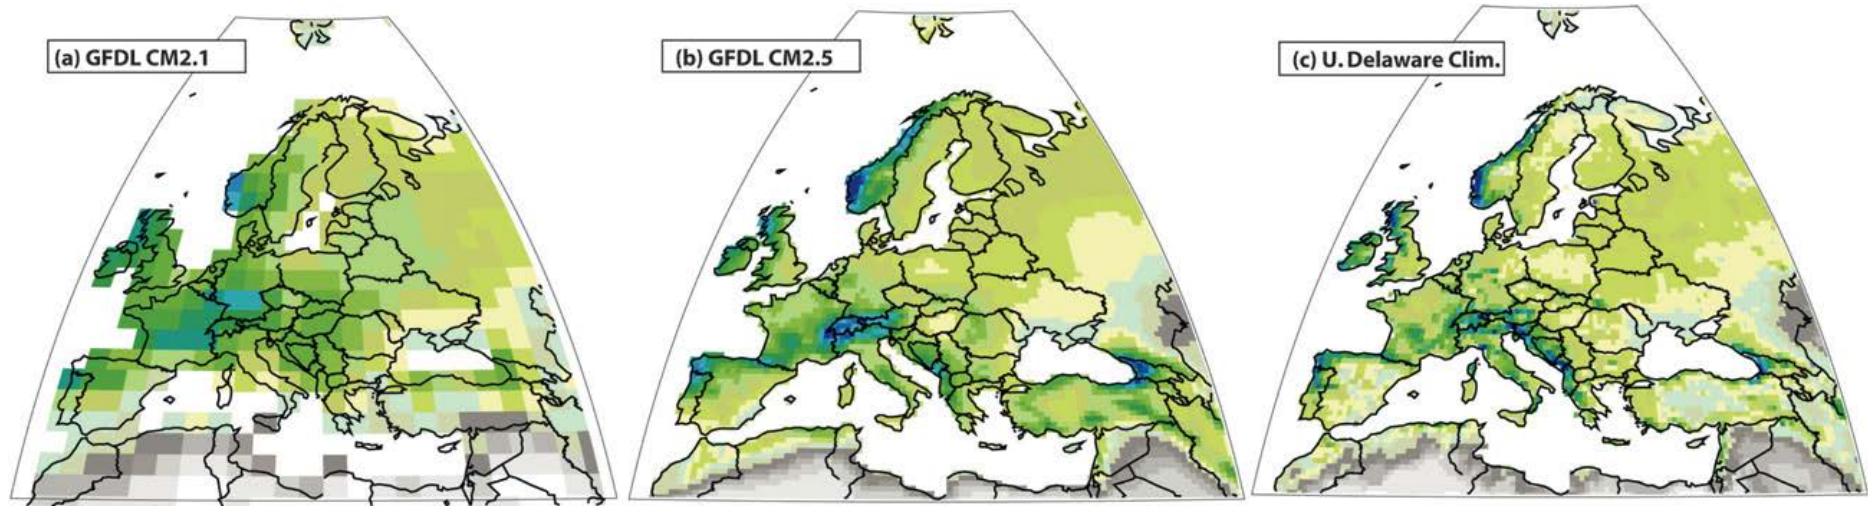

Boyle (1993) MWR

Brankovic and Gregory (2001) Clim. Dym.

...

Recent studies including very high resolution of state-of-the-art models had also discussed this topic.

# Annual Mean Precipitation

# Project Athena (1)

T159(126km), T511 (39km), T1279(16km), T2047(10km) simulations with ECMWF model.

Increasing horizontal resolution improves:

- tropical precipitation, tropical atmospheric circulation (related to time-step?),
- frequency of occurrence of Euro-Atlantic blocking (related to orography?),
- extratropical cyclones in large parts of the NH extratropics.
- Skill of seasonal prediction might be slightly increased in in the tropics and NH in boreal winter with T1279. No discernible effect for summer.
- Problems in simulating MJO remain unchanged.

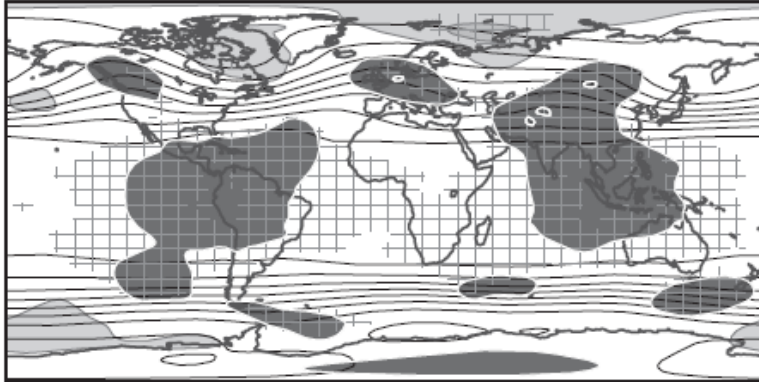

Differences in **track density** of vorticity maxima at 850 hPa from 13-month integrations for winters (DJF) during the period 1989/90–2007/08: (a) T159–ERA-Interim, (b) T511–ERA-Interim,

Differences in average (upper) **500-hPa geopotential height** and (lower) **precipitation** fields from 13-month integrations for winters (DJF) during 1989/90–2007/08: (a) T159–Reanalysis, (b) T511–T159

# Implication from High-resolution modelling

- High-resolution models would improve:
  - Meso-scale eddy activity, small-scale features in the wind stress curl around islands and oceanic SST fronts,
  - Cold tongue SST bias (ENSO mean states and variability),
  - Cold SST drift in the North Atlantic,
  - ....
- Increase both of atmosphere and ocean resolutions may be important. (cf. Roberts et al. 2004). Atmospheric model resolution about at least 100 km would be necessary so as to be able to respond to the fine-scale details in the ocean-surface properties.

(Shaffrey et al. 2009, Sakamoto et al. 2012)
- Eddy-resolving ocean models change coupled models' performance drastically.

(Delworth et al. 2012, Kirtman et al. 2012)

Some efforts and approaches

# Some efforts and approaches

- High-res. coupled model (straight way)
- Two tier system -> one tier system
- Variable-resolution prediction system
- Increasing resolution in atmospheric models
  - Horizontal resolution
  - Vertical resolution/ high-top model
- Ocean nesting in coupled model
- High resolution ocean data assimilation
- Alternative model for future HPCs

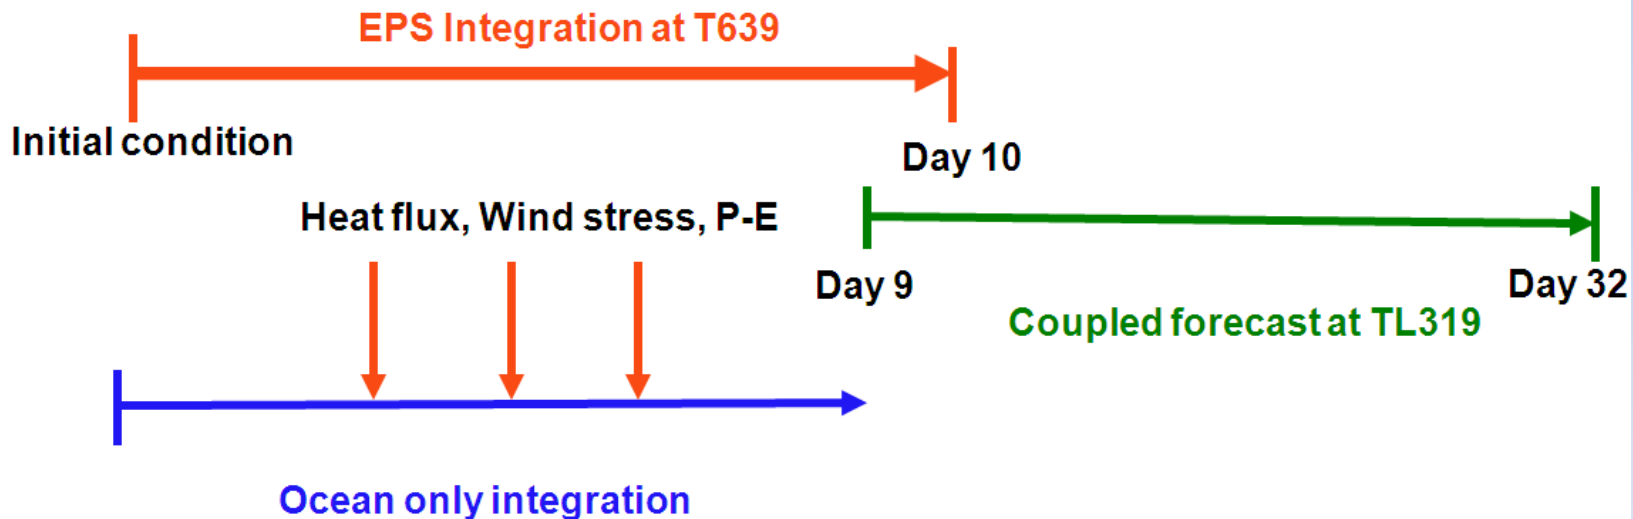

# Variable-resolution prediction system (1) - ECMWF example -

Buizza et al. (2007, QJRMS), Vitart et al. (2008, QJRMS)

The ECMWF VarEPS-monthly forecasting system

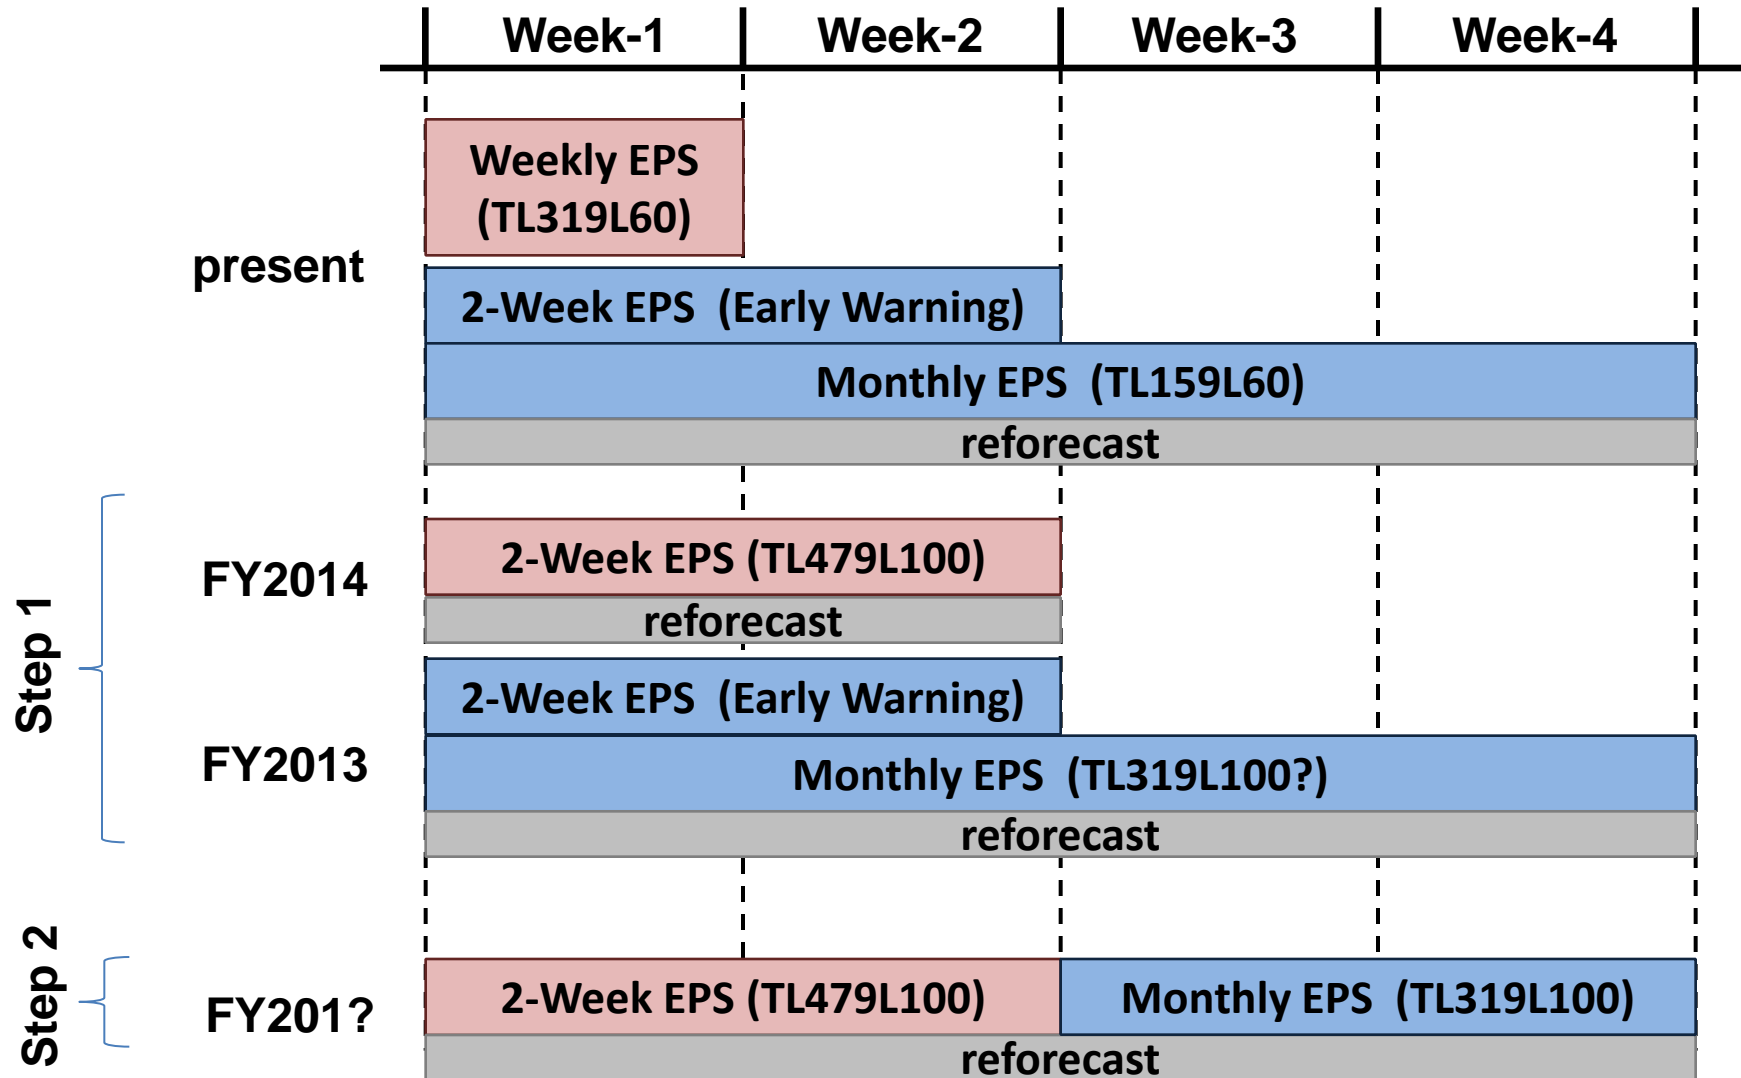

Current system (twice a week, 51 ensemble members):

From a presentation of Frederic Vitart at WWRP/THORPEX, WCRP Kick off meeting of Sub-seasonal to Seasonal Prediction (Geneva, 2011)

**\* The current ECMWF Monthly EPS is fully coupled.**

# Variable-resolution prediction system (3) - JMA plan -

All systems are currently planned to be uncoupled systems.

# Vertical resolution of AGCM

High-top is better!

But... it costs a lot!

**Burj Khalifa Dubai**  
829.84 m, 160 levels  
Opened January 2010

**Next JMA Model**  
high-top & high-resolution  
~80 km, 100 levels  
(under development)

# Stratospheric influence on the troposphere

Downward propagation of annular mode

CMIP5 simulations

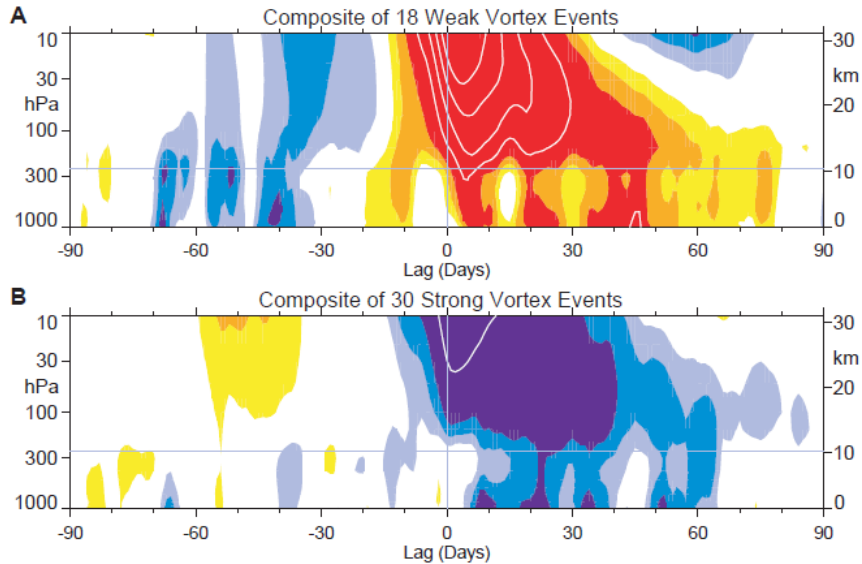

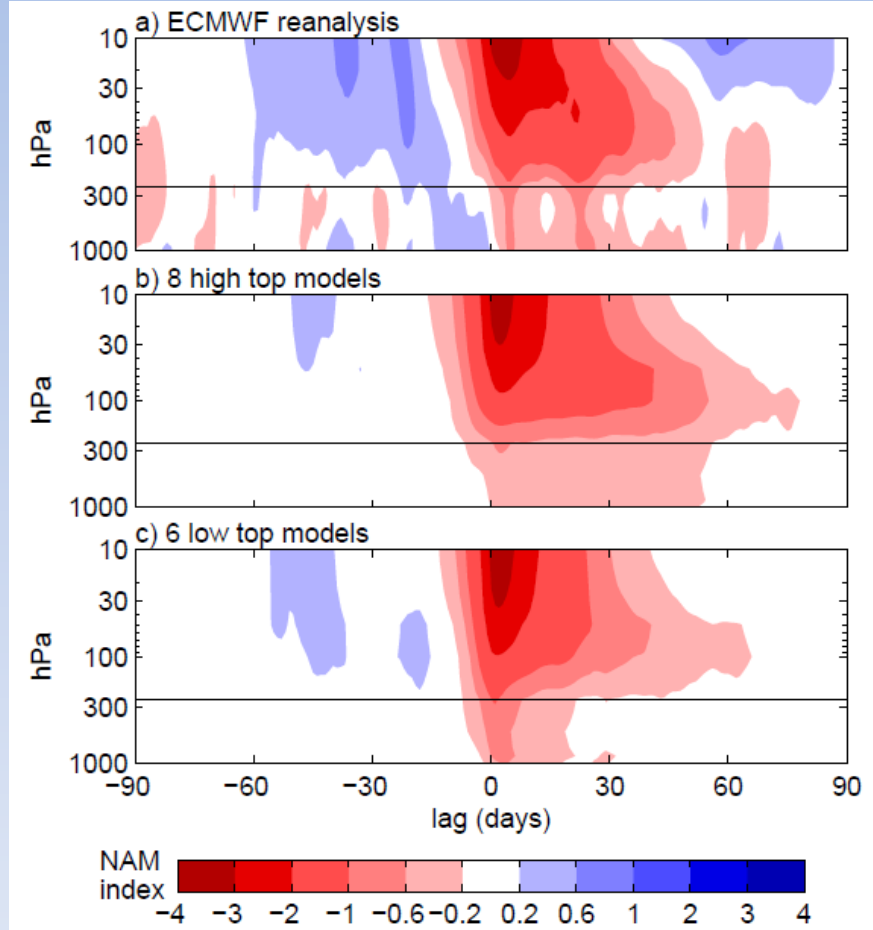

Fig. 2. Composites of time-height development of the northern annular mode for (A) 18 weak vortex events and (B) 30 strong vortex events. The events are determined by the dates on which the 10-hPa annular mode values cross  $-3.0$  and  $+1.5$ , respectively. The indices are nondimensional; the contour interval for the color shading is 0.25, and 0.5 for the white contours. Values between  $-0.25$  and  $0.25$  are unshaded. The thin horizontal lines indicate the approximate boundary between the troposphere and the stratosphere.

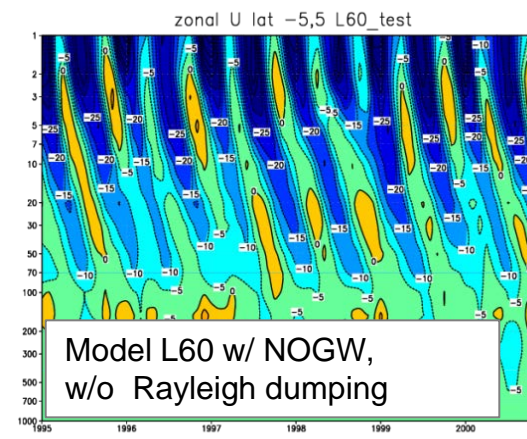

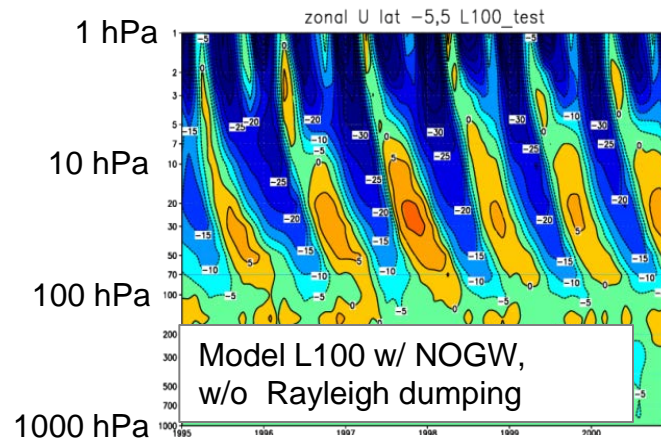

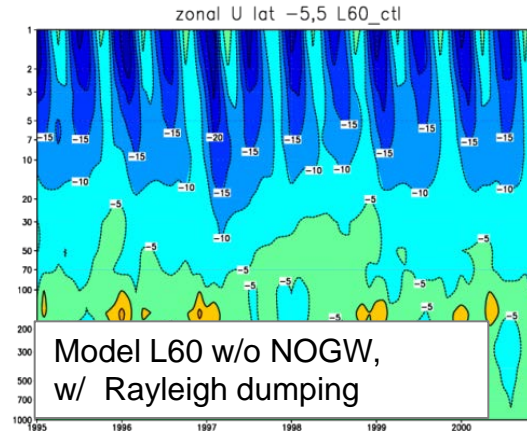

Baldwin and Dunkerton 2001 Science

Charlton-Perez et al. submitted to JGR

# Development of high-top & high vertical resolution model

Only increasing vertical levels doesn't give satisfactory results, appropriate treatments in model physics, analysis would be needed.

Time-vertical cross section of zonal wind averaged over 5N-5S from 6-year simulations.

Comparison with a newly developed non-orographic gravity wave parameterization (Scinocca 2003).

# Equatorial Pacific nested model

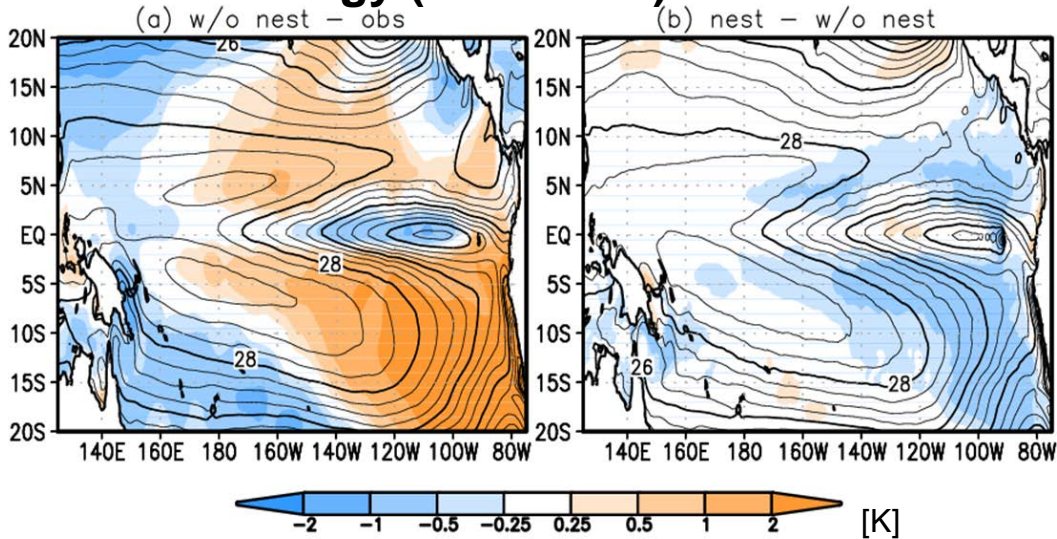

- Lon: 1/5, lat: 1/6
- Number of grids 1.25 times as much as the global model
- $dt = 20$  [min] (similar to OGCM)

# Impacts of the nested ocean model

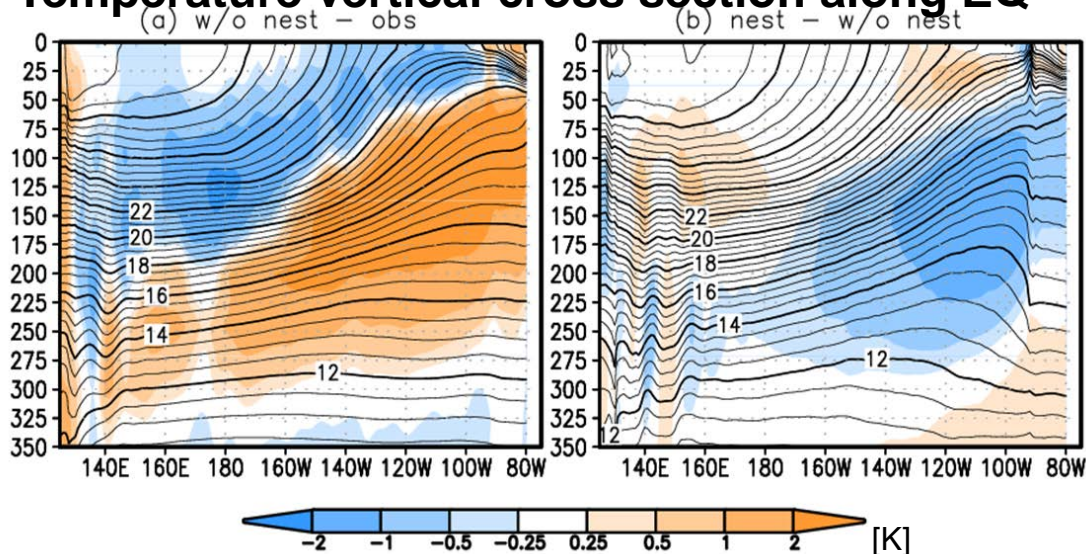

## SST climatology (1989-1993)

**Left:**  
Simulation w/o  
nesting minus  
observation (WOA98)

**Right:**  
Simulation w/ nesting  
minus w/o nesting

## Temperature vertical cross section along EQ

**Hiroyuki Tsujino (MRI/JMA)**

# Globally intermediate resolution or nested ?

-Upgrade from **1 x 0.5** to **0.5x0.5** would have marginal impacts.

- **Eddy permitting 0.25 x 0.25**

Poor representation of Kuroshio meander, and separation of boundary current.

CPU cost is **16 times** ( $4(\text{lon}) \times 2(\text{lat}) \times 2(\text{time})$ ).

- **Eddy resolving 0.1x0.1**

CPU cost is **200 times** ( $10(\text{lon}) \times 5(\text{lat}) \times 4(\text{time})$ ).

- **Nested model**

# of Grid Tropics:	2.33 times
North Western Pacific:	1.50
North Atlantic:	1.85
Global:	1

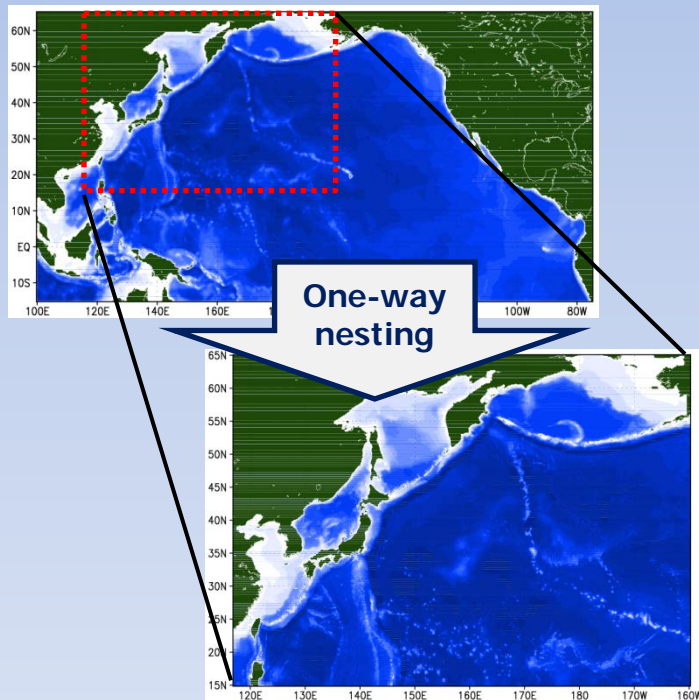

If the time step of the high-res.

$dt = 10\text{min} \rightarrow 20\text{min}$ , then

CPU time would be **13 times**.

# Next generation dynamical cores for climate projection / seasonal prediction (1)

- **AGCMs**

Substantial efforts have been made to develop new dynamical cores of AGCMs.

**Staniforth and Thuburn (2012) QJRMS**

**Icosahedral grid  
NICAM  
Satoh et al. 2008**

**Yin-Yang Grid  
Kageyama and Sato 2004  
Figure from Staniforth and  
Thuburn (2012)**

**Adaptive Mesh  
Refinement?  
cf. Slingo et al. 2009**

# Next generation dynamical cores for climate projection / seasonal prediction (2)

- **OGCMs**

OGCMs are grid models, and may not need radical change of dynamics for petascale computing architectures.

- **Couplers**

Communication softwares 'couplers' would be rather important, they are to be efficient enough for petascale computing architectures.

(OASIS4, Radler et al. 2010, S-CUP, Yoshimura 2008)

# Adaptive Mesh Refinement

Efforts are needed on

- Subgrid-scale parameterization
- Data assimilation (adjoint)
- Computational efficiency, parallelization, time stepping
- Refinement criteria
- Balance, local conservation etc.
- ...

# Future generation models for climate projection / seasonal prediction

- GPU parallel computing for weather, seasonal, climate predictions would be an option.

NOAA ESRL, parallelization of the NIM dynamical core

## NIM Code Design

- Uniform, hexagonal-based, icosahedral grid
  - 1 horizontal dimension
  - Novel indirect addressing scheme permits concise, efficient code
- Separated coarse and fine grain parallelization
  - CPU controls high level flow
    - Distributed memory parallelism (MPI)
    - Initialization, message passing, I/O
  - GPU executes dynamics routines
    - Data is resident in GPU memory
    - Data is passed to CPU only for I/O and inter GPU communications

**M.Govett, J. Middlecoff,  
T.Henderson, J.Rosinski,  
and C.Tierney, 2011**

From a presentation at  
Workshop on Dynamical  
Cores for Climate Models,  
2011, Lecce, Italy

# Summary

# Resolution required to resolve each process

Phenomena	Horizontal Scales	Ocean Model Res.	Atmosphere Model Res.
Meso-scale eddies in midlatitudes	$\sim O(100)$ km	< 25 km ( $\sim 10$ km)	< 50 km ( $< \sim 25$ km)
Tropical Instability Waves	$\sim O(1000)$ km	< 50 km	< 100 km ( $< \sim 50$ km)
Western Boundary Currents	$\sim O(100)$ km	< 25 km ( $\sim 10$ km)	< 50 km ( $< \sim 25$ km)

# Summary

- **Now climate models are going toward ocean eddies and weather resolving models.**
- **A lot of studies corroborate the advantage of high-resolution models in weather to climate time-scales.**
- **Some deficiencies may be ameliorated with some parameterizations or computationally-efficient tactics.**
- **The role of increasing model resolution in improving intra-seasonal to seasonal forecasts should continue to be explored considering available options.**

# Thank you for your kind attention.

With the advent of more powerful computers, it is now possible, for the first time, to model key processes and phenomena at the resolved scale over large domains, thus enabling multiscale interactions to be explored through the use of computational 'laboratories'.

Slingo et al. (2009)

Coupled climate system models in which the ocean component is eddy-resolving are on the horizon.

Bryan et al. (2010)
